## DEEP LEARNING

### Lecture #07 – Recurrent Neural Networks

Aykut Erdem // Hacettepe University // Spring 2020

HACETTEPE  
UNIVERSITY  
COMPUTER  
VISION LAB

# Previously on CMP784

- more on transfer learning
- interpretability
- visualizing neuron activations
- visualizing class activations
- pre-images
- adversarial examples
- adversarial training

# Lecture overview

- Sequence modeling
- Recurrent Neural Networks (RNNs)
- The Vanilla RNN unit
- How to train RNNs
- The Long Short-Term Memory (LSTM) unit and its variants
- Gated Recurrent Unit (GRU)

**Disclaimer:** Much of the material and slides for this lecture were borrowed from

—Harini Suresh's MIT 6.S191 slides

—Arun Mallya's tutorial on Recurrent Neural Networks

—Phil Blunsom's Oxford Deep NLP class

—Fei-Fei Li, Andrej Karpathy and Justin Johnson's CS231n class

# Sequence modeling

# Sequential data

- “I took the dog for a walk this morning.”

sentence

medical signals

speech waveform

video frames

# Modeling sequential data

- Sample data sequences from a certain distribution  $P(x_1, \dots, x_N)$
- Generate natural sentences to describe an image  $P(y_1, \dots, y_M | I)$

- Activity recognition from a video sequence

$$P(y | x_1, \dots, x_N)$$

- ☐ Running
- ☒ Jumping
- ☐ Dancing
- ☐ Fighting
- ☐ Eating

# Modeling sequential data

- Speech recognition

$$P(y_1, \dots, y_N | x_1, \dots, x_N)$$

- Object tracking

$$P(y_1, \dots, y_N | x_1, \dots, x_N)$$

# Modeling sequential data

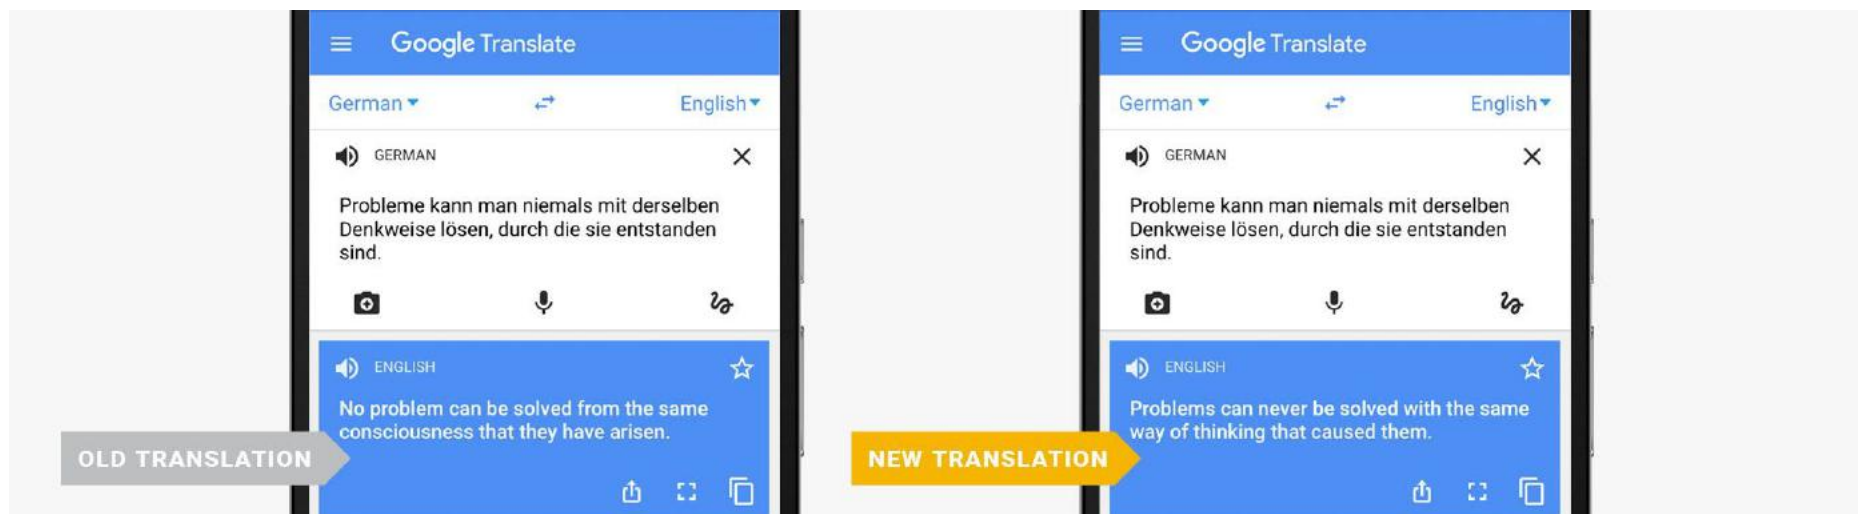

- Generate natural sentences to describe a video  $P(y_1, \dots, y_M | x_1, \dots, x_N)$

→ **A man is riding a bike**

- Machine translation

$$P(y_1, \dots, y_M | x_1, \dots, x_N)$$

# Represent a sequence as a *bag of words*

- **Problem:** Bag of words does not preserve order

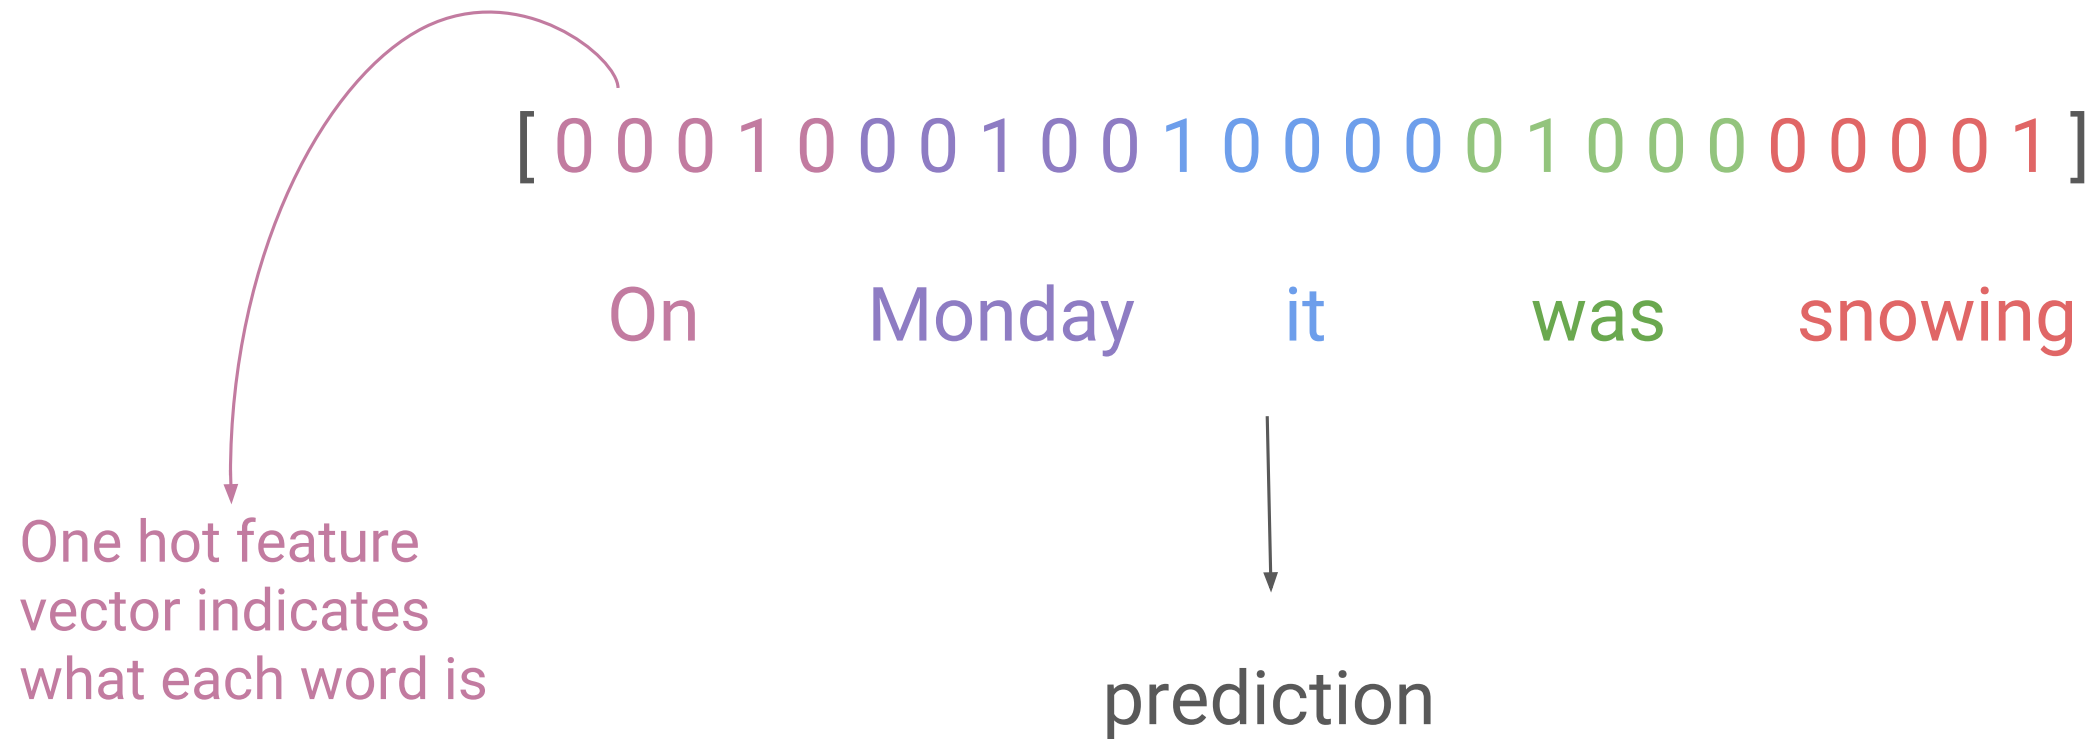

# Bag of words does not preserve order!

“The food was good, not bad at all.”

vs

“The food was bad, not good at all.”

# Maintain an ordering within feature vector

- **Problem:** Hard to deal with different word orders!

# Hard to deal with different word orders!

“On Monday, it was snowing.”

VS

“It was snowing on Monday.”

# Hard to deal with different word orders!

[ 0 0 0 1 0 0 0 1 0 0 1 0 0 0 0 0 1 0 0 0 0 0 0 0 0 1 ]

On Monday it was snowing

vs

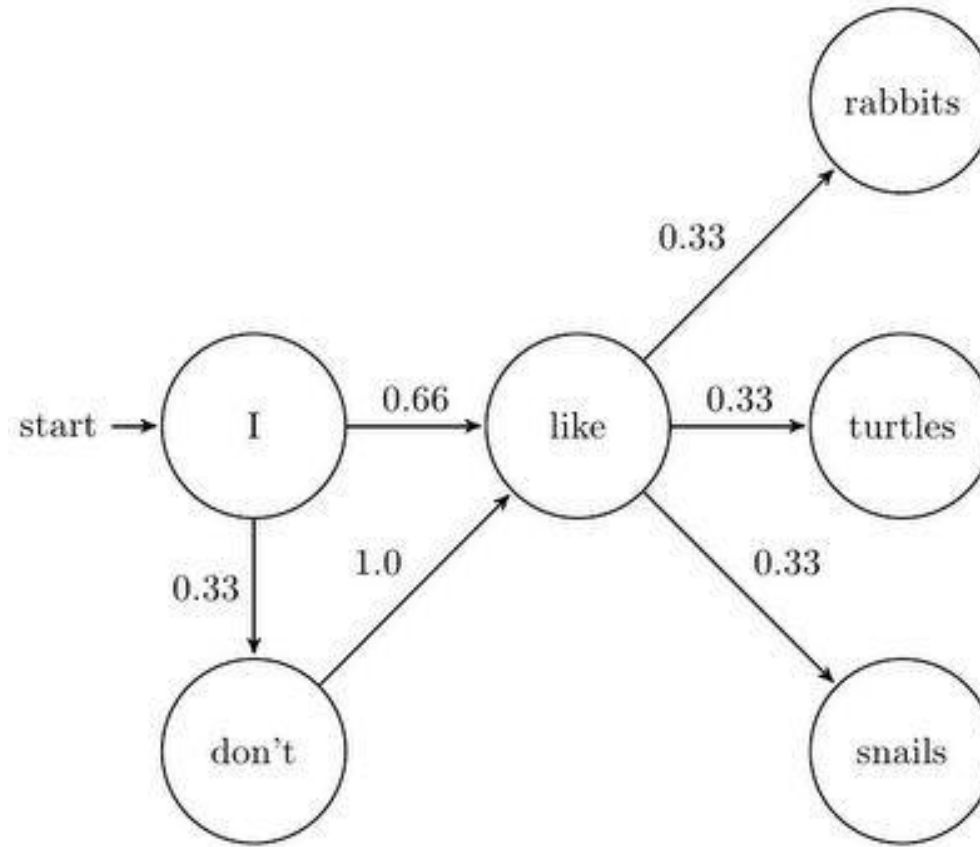

[ 1 0 0 0 0 0 0 1 0 0 0 0 0 0 0 0 1 0 0 0 1 0 0 0 1 0 0 ]

It was snowing on Monday

- we would have to **relearn the rules of language** at each point in the sentence

# Markov Models

- **Problem:** we can't model long-term dependencies

# Markov Models

- **Markov assumption:** Each state depends only on the last state.

“In **France**, I had a great time and I learnt some of the \_\_\_\_\_  
**language.**”

- We need information from the far past and future to accurately guess the correct word.

# To model sequences, we need

1. to deal with **variable length** sequences
2. to maintain **sequence order**
3. to keep track of **long-term dependencies**
4. to **share parameters** across the sequence

# Recurrent Neural Networks

# Recurrent Neural Networks

Feed Forward Network

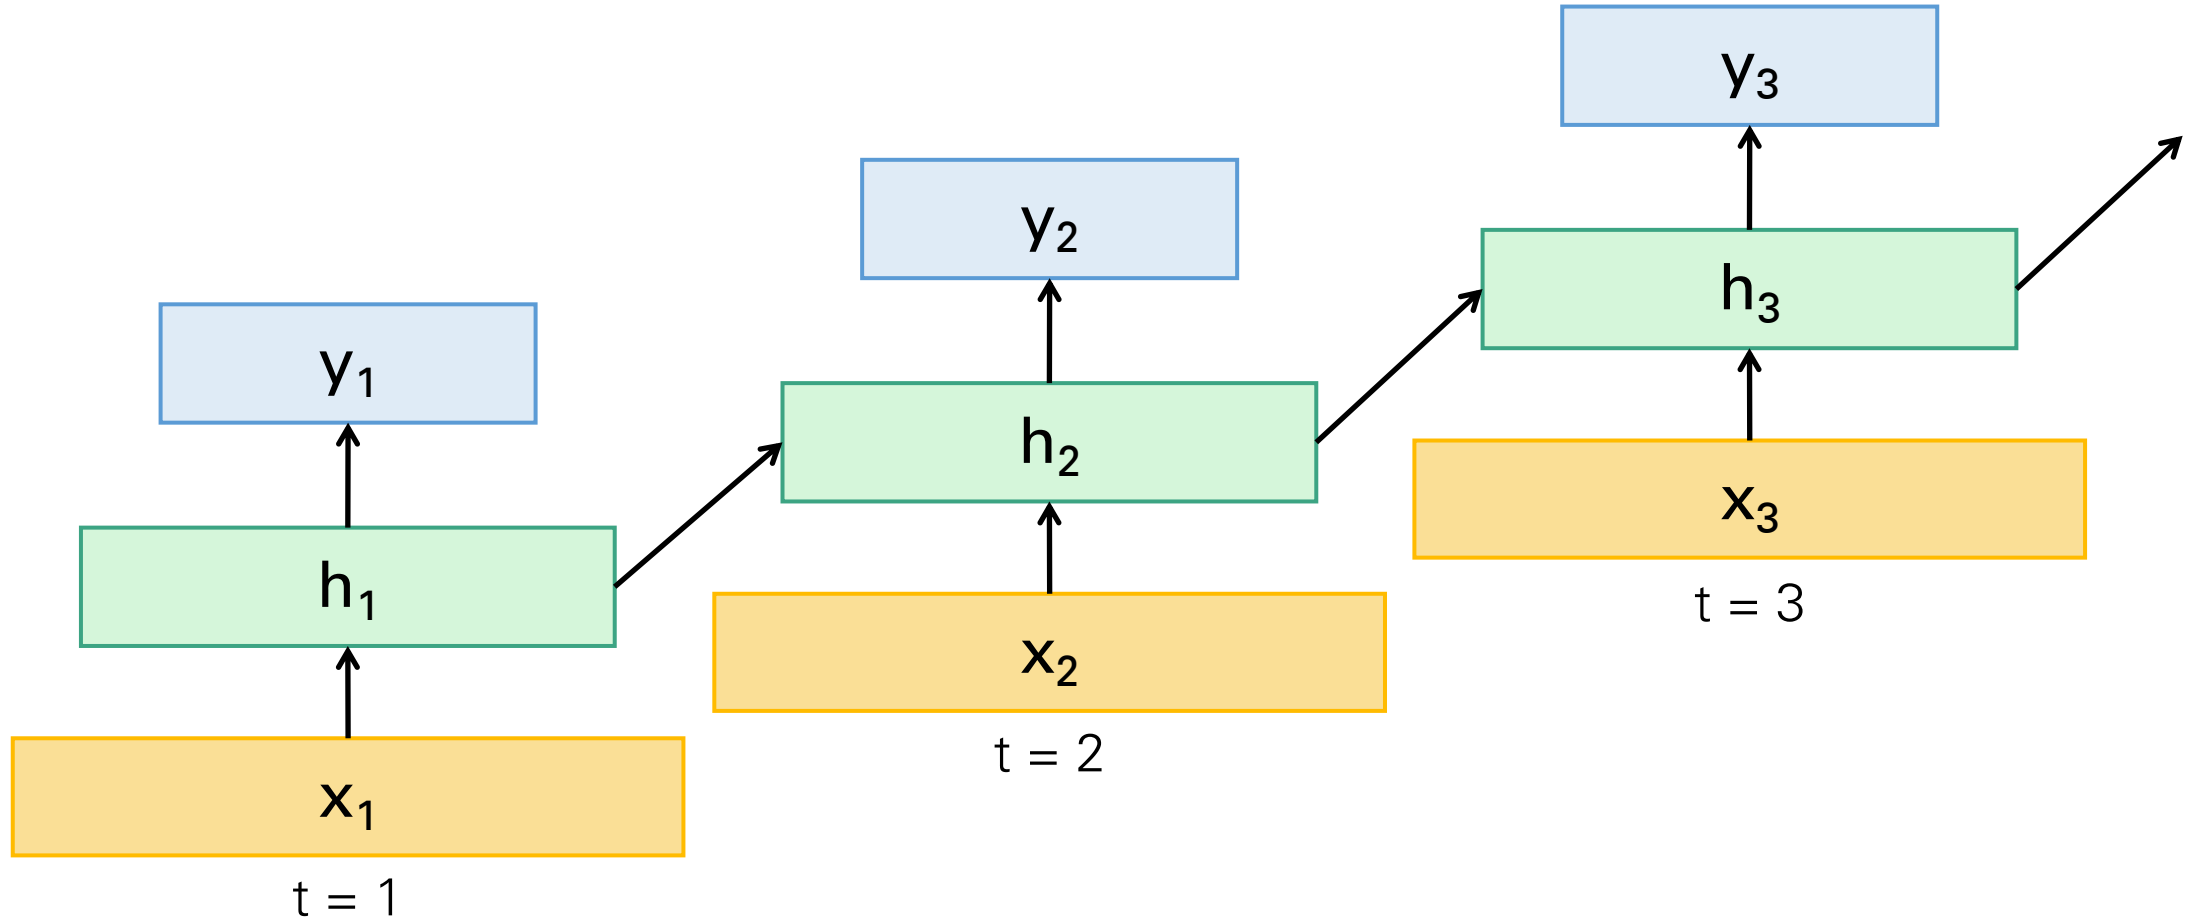

Recurrent Network

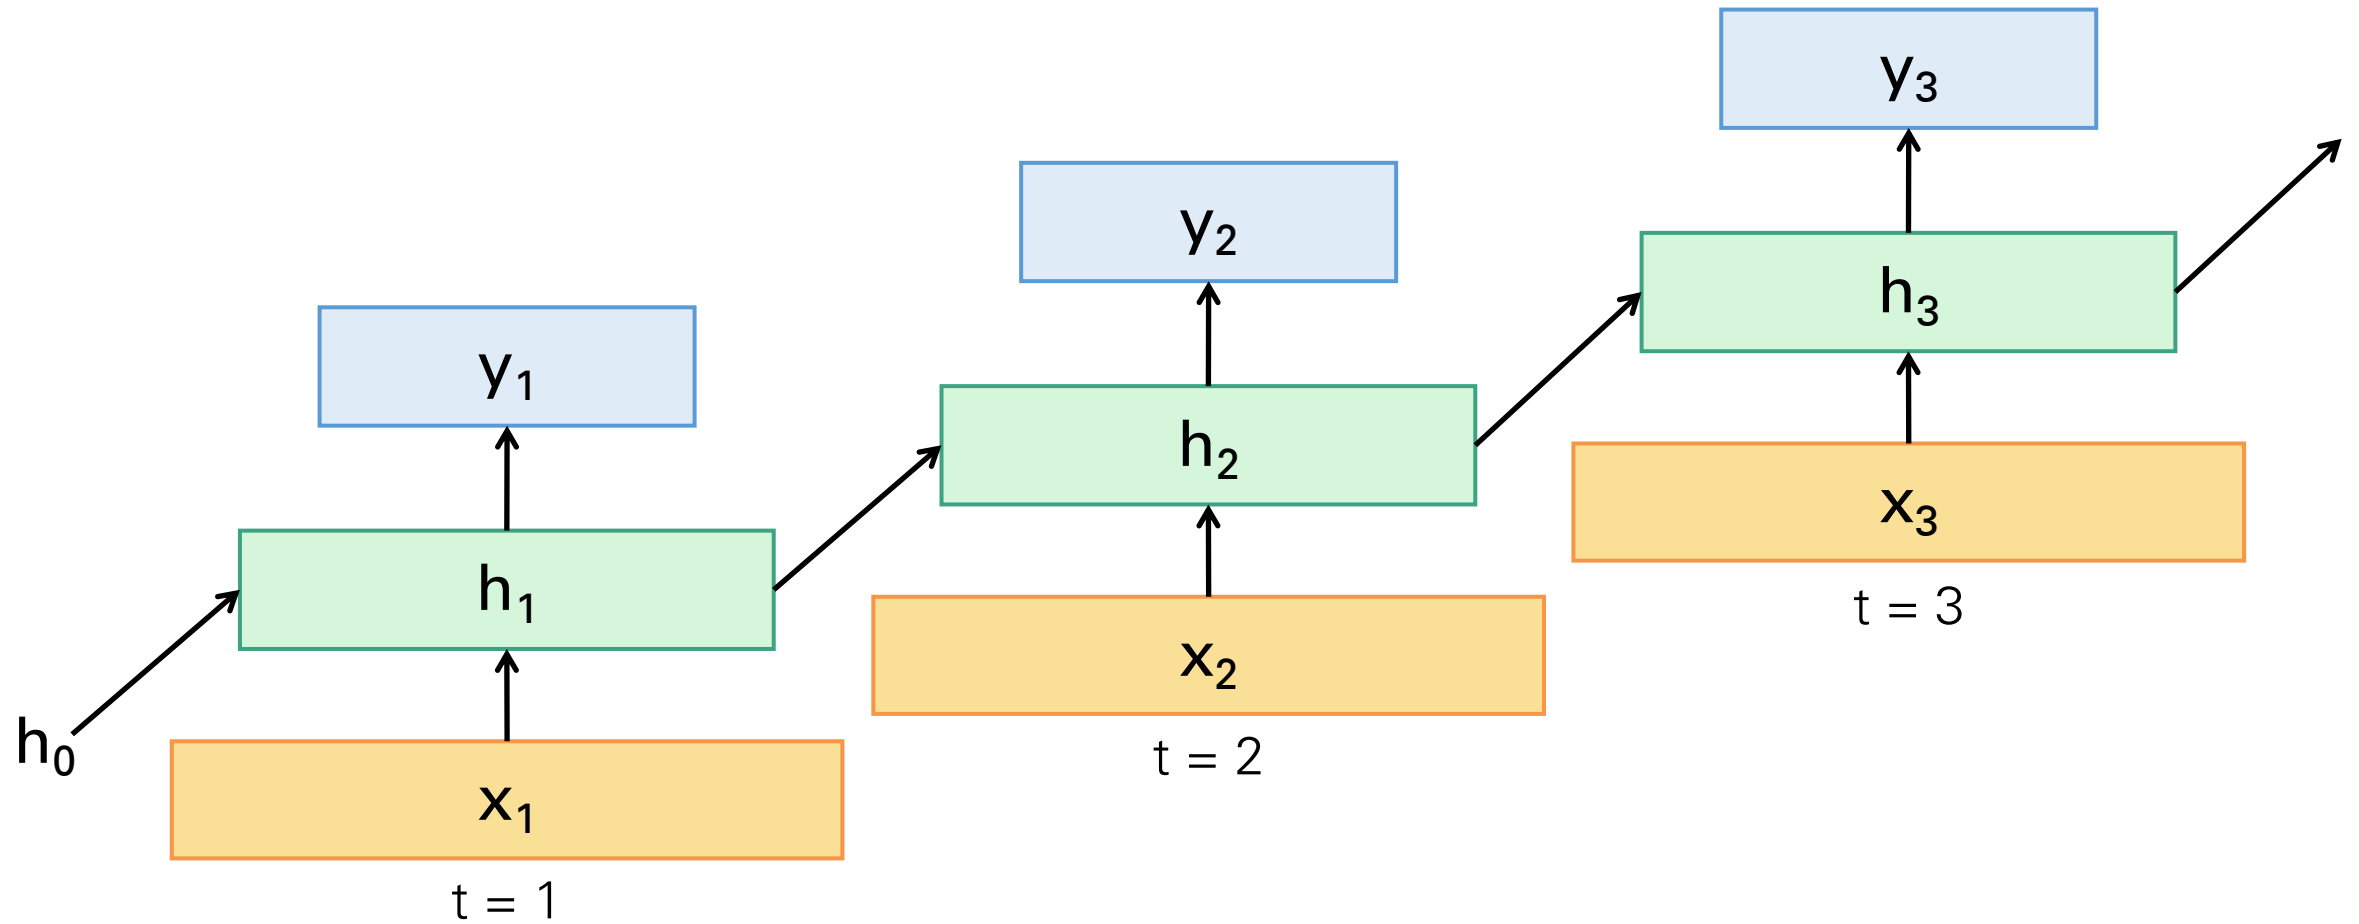

Notice: the same function and the same set of parameters are used at every time step.

# Unrolled RNN

# Sample RNN

# The Vanilla RNN Cell

$$h_t = \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} \quad \text{cell state}$$

# The Vanilla RNN Forward

$$h_t = \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

$$y_t = F(h_t)$$

$$C_t = \text{Loss}(y_t, \text{GT}_t)$$

# The Vanilla RNN Forward

$$h_t = \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

$$y_t = F(h_t)$$

$$C_t = \text{Loss}(y_t, \text{GT}_t)$$

----- indicates shared weights

- Note that the weights are shared over time
- Essentially, copies of the RNN cell are made over time (unrolling/unfolding), with different inputs at different time steps

# Sentiment Classification

# Sentiment Classification

- Classify a restaurant review from Yelp! OR movie review from IMDB OR ... as positive or negative
- **Inputs:** Multiple words, one or more sentences
- **Outputs:** Positive / Negative classification
- “The food was really good”
- “The chicken crossed the road because it was uncooked”

# Sentiment Classification

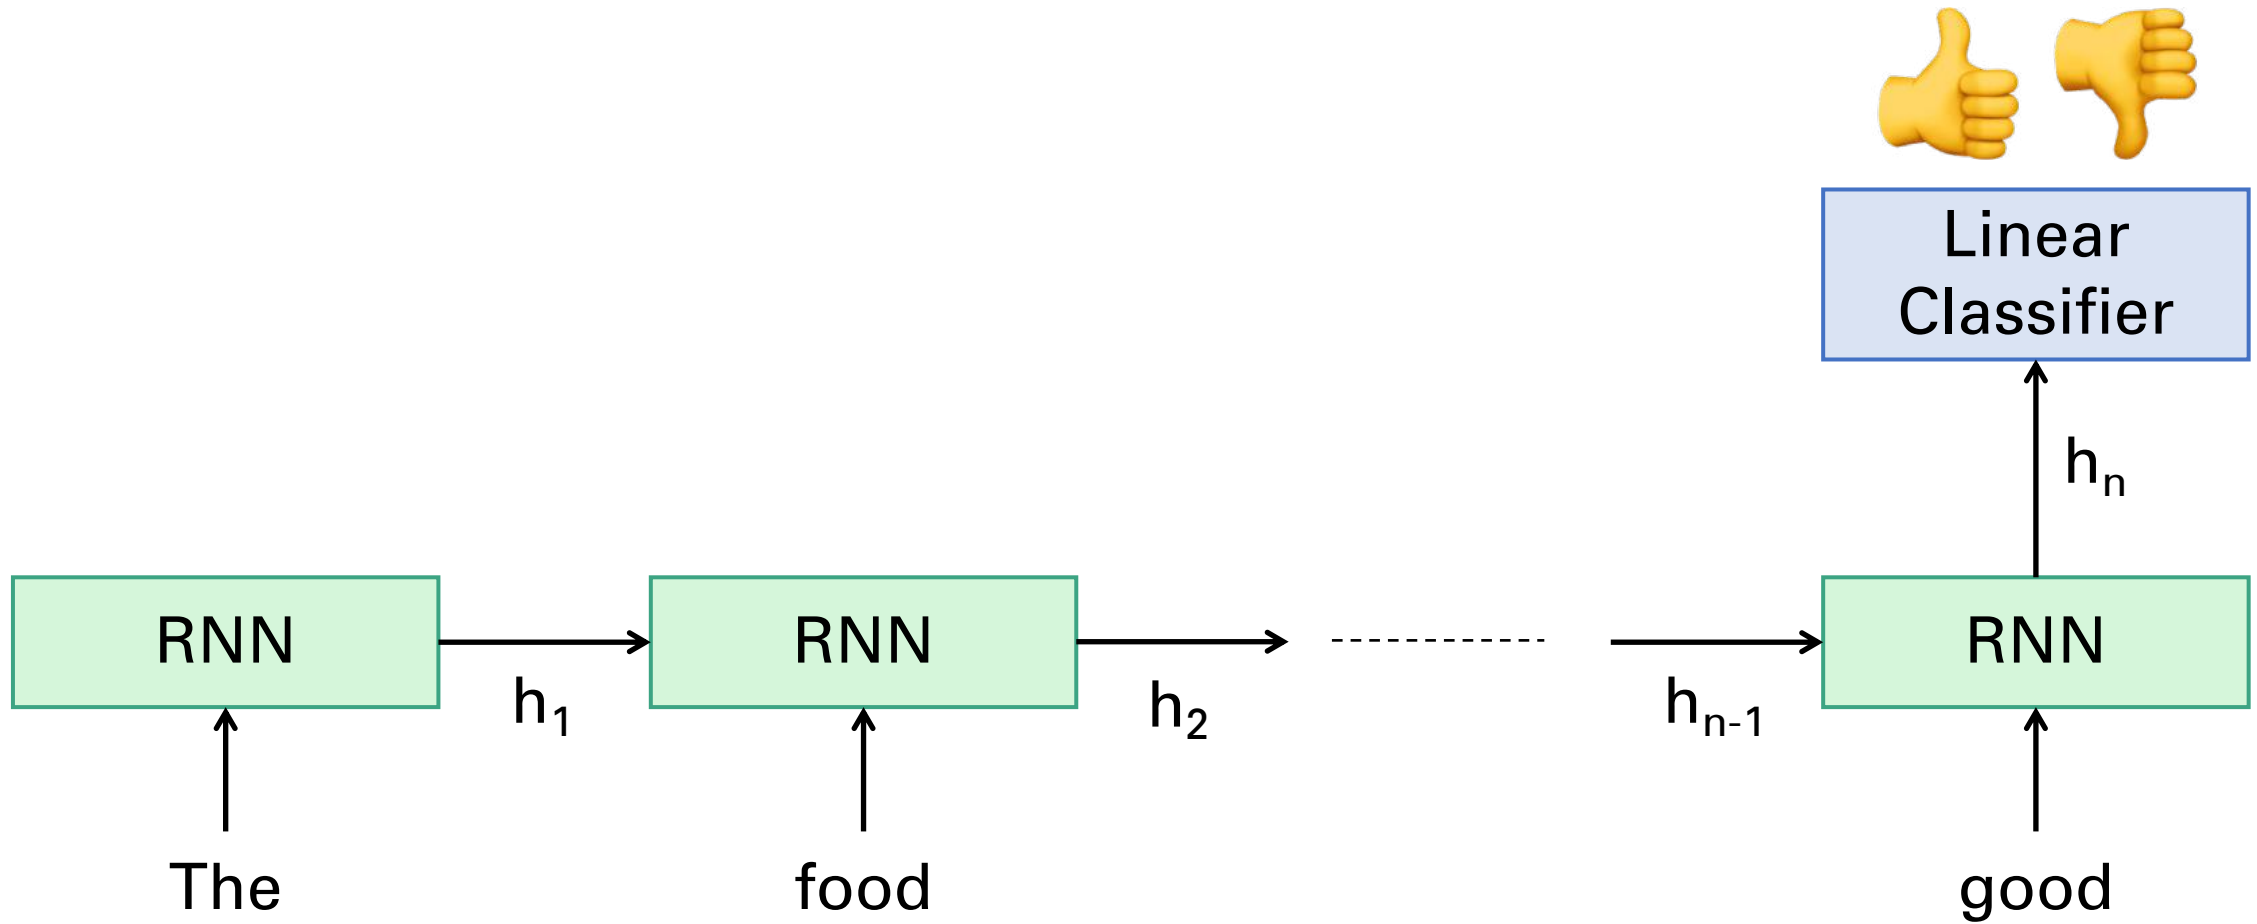

# Sentiment Classification

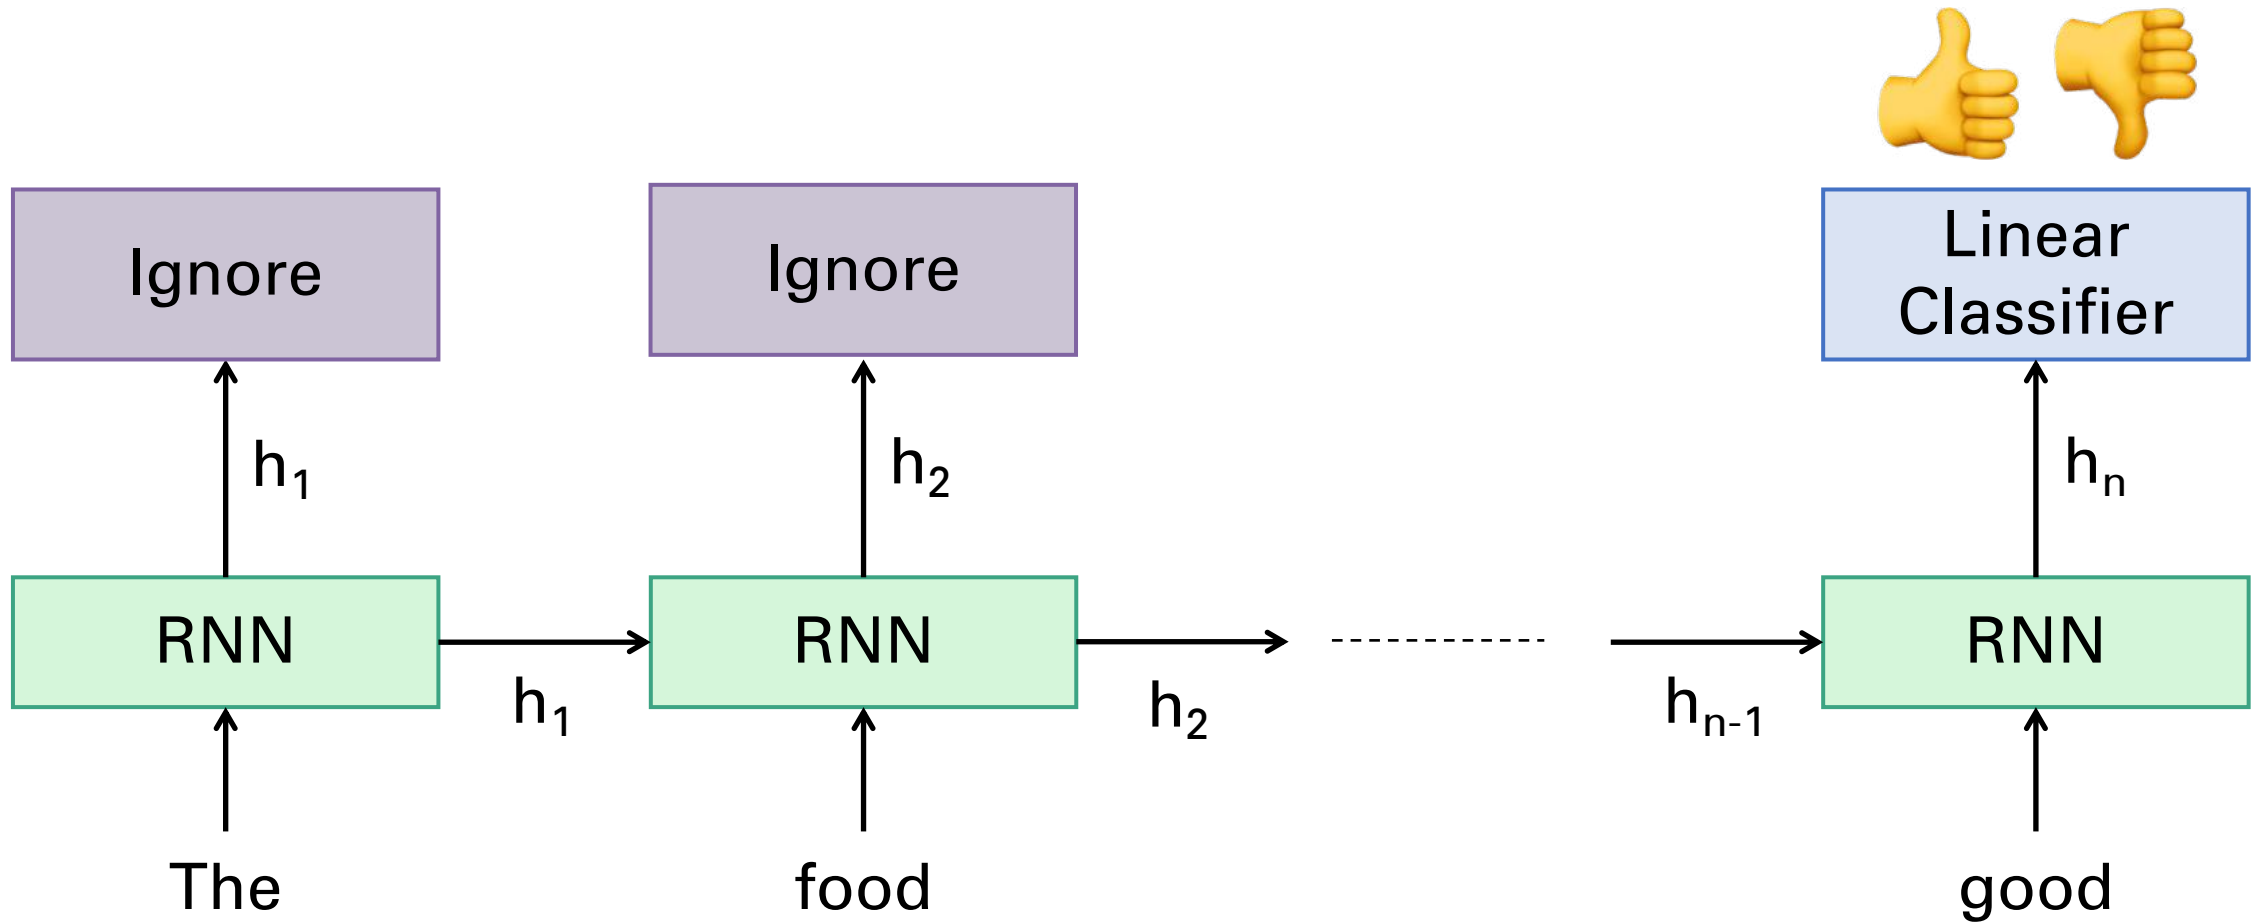

# Sentiment Classification

# Sentiment Classification

# Sentiment Classification

# Language Modeling

# Language Modeling

- Language models aim to represent the history of observed text  $(w_1, \dots, w_{t-1})$  succinctly in order to predict the next word  $(w_t)$ :

all the works of  
shakespeare

*language  
model*

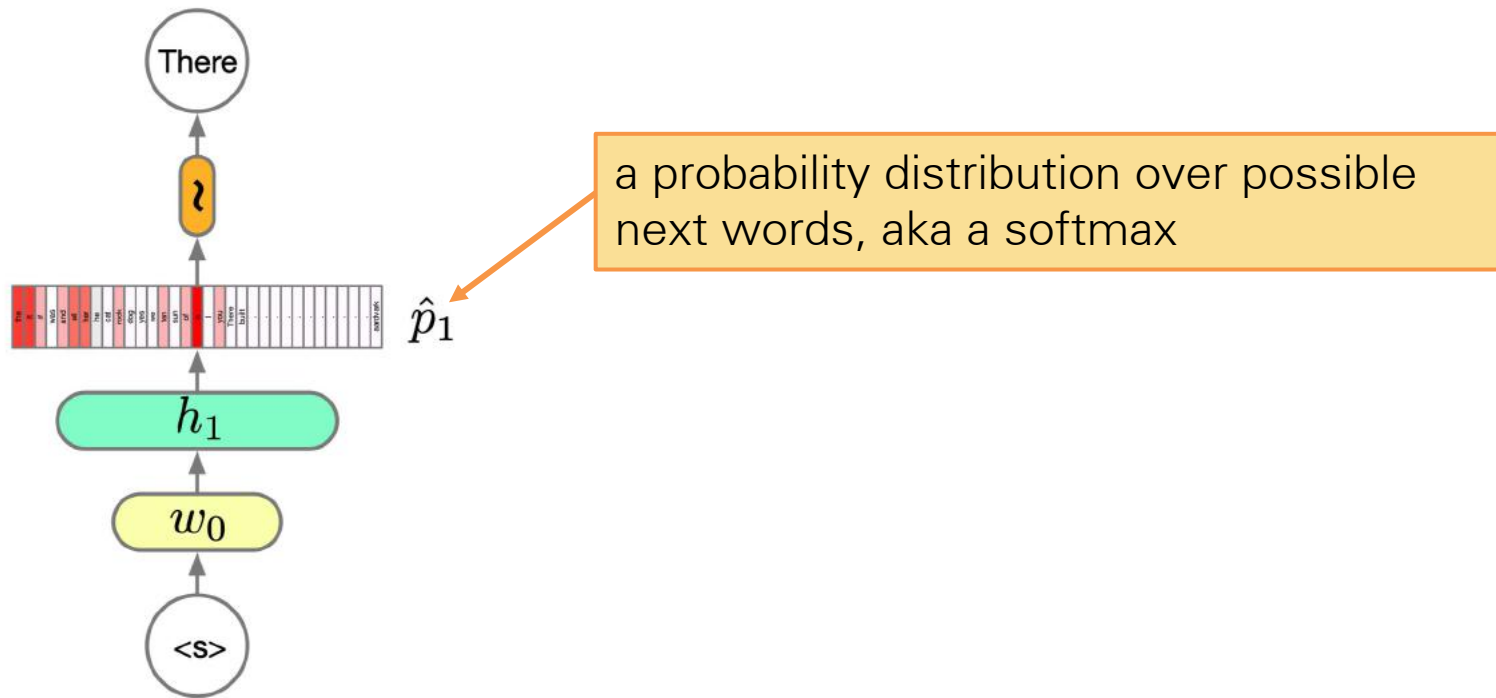

KING LEAR:

O, if you were a feeble sight,  
the courtesy of your law,  
Your sight and several breath,  
will wear the gods  
With his heads, and my hands  
are wonder'd at the deeds,  
So drop upon your lordship's  
head, and your opinion  
Shall be against your honour.

# RNN Language Models

$$h_n = g(V [x_n; h_{n-1}] + c)$$

$$\hat{y}_n = W h_n + b$$

# RNN Language Models

$$h_n = g(V [x_n; h_{n-1}] + c)$$

$$\hat{y}_n = W h_n + b$$

# RNN Language Models

$$h_n = g(V [x_n; h_{n-1}] + c)$$

$$\hat{y}_n = W h_n + b$$

# RNN Language Models

$$h_n = g(V[x_n; h_{n-1}] + c)$$

$$\hat{y}_n = W h_n + b$$

"Why do what that day," replied Natasha, and wishing to himself the fact the  
princess, Princess Mary was easier, fed in had oftended him.  
Pierre aking his soul came to the packs and drove up his father-in-law women.

PANDARUS:

Alas, I think he shall be come approached and the day  
When little strain would be attain'd into being never fed,  
And who is but a chain and subjects of his death,  
I should not sleep.

Second Senator:

They are away this miseries, produced upon my soul,  
Breaking and strongly should be buried, when I perish  
The earth and thoughts of many states.

DUKE VINCENTIO:

Well, your wit is in the care of side and that.

Second Lord:

They would be ruled after this chamber, and  
my fair nudes begun out of the fact, to be conveyed,  
Whose noble souls I'll have the heart of the wars.

Clown:

Come, sir, I will make did behold your worship.

VIOLA:

I'll drink it.

VIOLA:

Why, Salisbury must find his flesh and thought  
That which I am not apt, not a man and in fire,  
To show the reining of the raven and the wars  
To grace my hand reproach within, and not a fair are hand,  
That Caesar and my goodly father's world;  
When I was heaven of presence and our fleets,  
We spare with hours, but cut thy council I am great,  
Murdered and by thy master's ready there  
My power to give thee but so much as hell:  
Some service in the noble bondman here,  
Would show him to her wine.

KING LEAR:

O, if you were a feeble sight, the courtesy of your law,  
Your sight and several breath, will wear the gods  
With his heads, and my hands are wonder'd at the deeds,  
So drop upon your lordship's head, and your opinion  
Shall be against your honour.

# More Language Modeling Fun – DeepDrumpf

## DeepDrumpf

@DeepDrumpf

I'm a Neural Network trained on Trump's transcripts. Priming text in [ ]s. Donate ([gofundme.com/deepdrumpf](https://gofundme.com/deepdrumpf)) to interact! Created by @hayesbh.

# Class Exercise

- Consider the problem of translation of English to French
- E.g. What is your name → Comment tu t'appelle
- Is the below architecture suitable for this problem?

# Class Exercise

- Consider the problem of translation of English to French
- E.g. What is your name → Comment tu t'appelle
- Is the below architecture suitable for this problem?

- No, sentences might be of different length and words might not align. Need to see entire sentence before translating

# Encoder-Decoder Seq2Seq Model

- Consider the problem of translation of English to French
- E.g. What is your name → Comment tu t'appelle
- Sentences might be of different length and words might not align.  
Need to see entire sentence before translating

- Input-Output nature depends on the structure of the problem at hand

# Multi-layer RNNs

- We can of course design RNNs with multiple hidden layers

- Think exotic: Skip connections across layers, across time, ...

# Bi-directional RNNs

- RNNs can process the input sequence in forward and in the reverse direction

- Popular in speech recognition and machine translation

# How to Train Recurrent Neural Networks

# BackPropagation Refresher

$$y = f(x; W)$$
$$C = \text{Loss}(y, y_{GT})$$

SGD Update

$$W \leftarrow W - \eta \frac{\partial C}{\partial W}$$

$$\frac{\partial C}{\partial W} = \left( \frac{\partial C}{\partial y} \right) \left( \frac{\partial y}{\partial W} \right)$$

# Multiple Layers

$$y_1 = f_1(x; W_1)$$
$$y_2 = f_2(y_1; W_2)$$
$$C = \text{Loss}(y_2, y_{GT})$$

SGD Update

$$W_2 \leftarrow W_2 - \eta \frac{\partial C}{\partial W_2}$$

$$W_1 \leftarrow W_1 - \eta \frac{\partial C}{\partial W_1}$$

# Chain Rule for Gradient Computation

$$\begin{aligned}y_1 &= f_1(x; W_1) \\ y_2 &= f_2(y_1; W_2) \\ C &= \text{Loss}(y_2, y_{GT})\end{aligned}$$

$$\text{Find } \frac{\partial C}{\partial W_1}, \frac{\partial C}{\partial W_2}$$

$$\frac{\partial C}{\partial W_2} = \left( \frac{\partial C}{\partial y_2} \right) \left( \frac{\partial y_2}{\partial W_2} \right)$$

$$\frac{\partial C}{\partial W_1} = \left( \frac{\partial C}{\partial y_1} \right) \left( \frac{\partial y_1}{\partial W_1} \right)$$

$$= \left( \frac{\partial C}{\partial y_2} \right) \left( \frac{\partial y_2}{\partial y_1} \right) \left( \frac{\partial y_1}{\partial W_1} \right)$$

Application of the Chain Rule

# Chain Rule for Gradient Computation

Given:  $\left(\frac{\partial \mathcal{C}}{\partial y}\right)$

We are interested in computing:  $\left(\frac{\partial \mathcal{C}}{\partial W}\right), \left(\frac{\partial \mathcal{C}}{\partial x}\right)$

Intrinsic to the layer are:

$\left(\frac{\partial y}{\partial W}\right)$  – How does output change due to params

$\left(\frac{\partial y}{\partial x}\right)$  – How does output change due to inputs

$$\left(\frac{\partial \mathcal{C}}{\partial W}\right) = \left(\frac{\partial \mathcal{C}}{\partial y}\right) \left(\frac{\partial y}{\partial W}\right) \quad \left(\frac{\partial \mathcal{C}}{\partial x}\right) = \left(\frac{\partial \mathcal{C}}{\partial y}\right) \left(\frac{\partial y}{\partial x}\right)$$

# Chain Rule for Gradient Computation

# Extension to Computational Graphs

# Extension to Computational Graphs

# Extension to Computational Graphs

# Sample RNN

- RNNs remember their previous state:

$x_0$  : vector representing first word  
 $s_0$  : cell state at  $t = 0$  (some initialization)  
 $s_1$  : cell state at  $t = 1$

$$s_1 = \tanh(Wx_0 + Us_0)$$

$W, U$  : weight matrices

# Sample RNN

- RNNs remember their previous state:

$x_1$  : vector representing second word

$s_1$  : cell state at  $t = 1$

$s_2$  : cell state at  $t = 2$

$$s_2 = \tanh(Wx_1 + Us_1)$$

$W, U$  : weight matrices

# Sample RNN

- “unfolding” the RNN across time:

notice that  $W$  and  $U$   
stay the same!

# Sample RNN

- “unfolding” the RNN across time:

$s_n$  can contain  
information from all  
past timesteps

# We have a **loss** at each timestep:

(since we're making a prediction at each timestep)

# We have a **loss at each timestep**:

(since we're making a prediction at each timestep)

# We sum the losses across time:

Loss at time  $t$ :  $J_t(\Theta)$

Total loss:

$$J(\Theta) = \sum_t J_t(\Theta)$$

# Let's try it out for W with the **chain rule**:

$$\frac{\partial J}{\partial W} = \sum_t \frac{\partial J_t}{\partial W}$$

# Let's try it our for W with the **chain rule**:

$$\frac{\partial J}{\partial W} = \sum_t \frac{\partial J_t}{\partial W}$$

so let's take a single timestep t:

# Let's try it out for W with the **chain rule**:

$$\frac{\partial J}{\partial W} = \sum_t \frac{\partial J_t}{\partial W}$$

so let's take a single timestep  $t$ :

$$\frac{\partial J_2}{\partial W}$$

# Let's try it out for W with the **chain rule**:

$$\frac{\partial J}{\partial W} = \sum_t \frac{\partial J_t}{\partial W}$$

so let's take a single timestep  $t$ :

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial y_2}$$

# Let's try it out for W with the **chain rule**:

$$\frac{\partial J}{\partial W} = \sum_t \frac{\partial J_t}{\partial W}$$

so let's take a single timestep t:

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2}$$

# Let's try it out for W with the **chain rule**:

$$\frac{\partial J}{\partial W} = \sum_t \frac{\partial J_t}{\partial W}$$

so let's take a single timestep  $t$ :

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \frac{\partial s_2}{\partial W}$$

# Let's try it our for W with the **chain rule**:

$$\frac{\partial J}{\partial W} = \sum_t \frac{\partial J_t}{\partial W}$$

so let's take a single timestep  $t$ :

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \boxed{\frac{\partial s_2}{\partial W}}$$

but wait...

# Let's try it out for W with the **chain rule**:

$$\frac{\partial J}{\partial W} = \sum_t \frac{\partial J_t}{\partial W}$$

so let's take a single timestep  $t$ :

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \boxed{\frac{\partial s_2}{\partial W}}$$

but wait...

$$s_2 = \tanh(U s_1 + W x_2)$$

# Let's try it out for $W$ with the **chain rule**:

$$\frac{\partial J}{\partial W} = \sum_t \frac{\partial J_t}{\partial W}$$

so let's take a single timestep  $t$ :

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \boxed{\frac{\partial s_2}{\partial W}}$$

but wait...

$$s_2 = \tanh(U \boxed{s_1} + W x_2)$$

An arrow points from the boxed  $s_1$  term in the equation down towards the explanatory text below.

$s_1$  also depends on  $W$  so we can't just treat  $\frac{\partial s_2}{\partial W}$  as a constant!

# Let's try it our for W with the **chain rule**:

# Let's try it our for W with the **chain rule**:

$$\frac{\partial s_2}{\partial W}$$

# Let's try it our for W with the **chain rule**:

$$\frac{\partial s_2}{\partial W} + \frac{\partial s_2}{\partial s_1} \frac{\partial s_1}{\partial W}$$

Let's try it our for  $W$  with the **chain rule**:

$$\begin{aligned} & \frac{\partial s_2}{\partial W} \\ & + \frac{\partial s_2}{\partial s_1} \frac{\partial s_1}{\partial W} \\ & + \frac{\partial s_2}{\partial s_0} \frac{\partial s_0}{\partial W} \end{aligned}$$

# Backpropagation through time:

$$\frac{\partial J_2}{\partial W} = \sum_{k=0}^2 \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \underbrace{\frac{\partial s_2}{\partial s_k} \frac{\partial s_k}{\partial W}}_{\text{Contributions of } W \text{ in previous timesteps to the error at timestep } t}$$

Contributions of  $W$  in previous timesteps to the error at timestep  $t$

# Backpropagation through time:

$$\frac{\partial J_t}{\partial W} = \sum_{k=0}^t \underbrace{\frac{\partial J_t}{\partial y_t} \frac{\partial y_t}{\partial s_t} \frac{\partial s_t}{\partial s_k} \frac{\partial s_k}{\partial W}}_{\text{Contributions of } W \text{ in previous timesteps to the error at timestep } t}$$

Contributions of  $W$  in previous timesteps to the error at timestep  $t$

# Why are RNNs hard to train?

# Vanishing Gradient Problem

$$\frac{\partial J_2}{\partial W} = \sum_{k=0}^2 \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \boxed{\frac{\partial s_2}{\partial s_k}} \frac{\partial s_k}{\partial W}$$

# Vanishing Gradient Problem

$$\frac{\partial J_2}{\partial W} = \sum_{k=0}^2 \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \boxed{\frac{\partial s_2}{\partial s_k}} \frac{\partial s_k}{\partial W}$$

at  $k=0$ :

$$\boxed{\frac{\partial s_2}{\partial s_0} = \frac{\partial s_2}{\partial s_1} \frac{\partial s_1}{\partial s_0}}$$

# Vanishing Gradient Problem

$$\frac{\partial J_n}{\partial W} = \sum_{k=0}^n \frac{\partial J_n}{\partial y_n} \frac{\partial y_n}{\partial s_n} \boxed{\frac{\partial s_n}{\partial s_k}} \frac{\partial s_k}{\partial W}$$

$$\frac{\partial s_n}{\partial s_{n-1}} \frac{\partial s_{n-1}}{\partial s_{n-2}} \cdots \frac{\partial s_3}{\partial s_2} \frac{\partial s_2}{\partial s_1} \frac{\partial s_1}{\partial s_0}$$

as the gap between timesteps gets bigger, this product gets longer and longer!

# Vanishing Gradient Problem

what are each of these terms? →

$$\frac{\partial s_n}{\partial s_{n-1}} \frac{\partial s_{n-1}}{\partial s_{n-2}} \cdots \frac{\partial s_3}{\partial s_2} \frac{\partial s_2}{\partial s_1} \frac{\partial s_1}{\partial s_0}$$

$$\frac{\partial s_n}{\partial s_{n-1}} = W^T \text{diag} [f'(W s_{j-1} + U x_j)]$$

$W$  = sampled from standard normal distribution = mostly  $< 1$

$f = \tanh$  or sigmoid so  $f' < 1$

**we're multiplying a lot of small numbers together.**

# Vanishing Gradient Problem

we're multiplying a lot of **small numbers** together.

**so what?**

errors due to further back timesteps have increasingly **smaller gradients**.

**so what?**

parameters become biased to **capture shorter-term** dependencies.

# A Toy Example

- 2 categories of sequences
- Can the single tanh unit learn to store for  $T$  time steps 1 bit of information given by the sign of initial input?

# Vanishing Gradient Problem

“In France, I had a great time and I learnt some of the \_\_\_\_\_ language.”

our parameters are not trained to capture long-term dependencies, so the word we predict will mostly depend on the previous few words, not much earlier ones

# Long-Term Dependencies

- The RNN gradient is a product of Jacobian matrices, each associated with a step in the forward computation. To store information robustly in a finite-dimensional state, the dynamics must be contractive [Bengio et al 1994].

$$L = L(s_T(s_{T-1}(\dots s_{t+1}(s_t, \dots))))$$
$$\frac{\partial L}{\partial s_t} = \frac{\partial L}{\partial s_T} \frac{\partial s_T}{\partial s_{T-1}} \dots \frac{\partial s_{t+1}}{\partial s_t}$$

- Problems:
  - sing. values of Jacobians  $> 1 \rightarrow$  **gradients explode**
  - or sing. values  $< 1 \rightarrow$  **gradients shrink & vanish**
  - or random  $\rightarrow$  **variance grows exponentially**

# RNN Tricks

(Pascanu et al., 2013; Bengio et al., 2013; Gal and Ghahramani, 2016; Morishita et al., 2017)

- Mini-batch creation strategies (efficient computations)
- Clipping gradients (avoid exploding gradients)
- Leaky integration (propagate long-term dependencies)
- Momentum (cheap 2nd order)
- Dropout (avoid overfitting)
- Initialization (start in right ballpark avoids exploding/vanishing)
- Sparse Gradients (symmetry breaking)
- Gradient propagation regularizer (avoid vanishing gradient)
- Gated self-loops (LSTM & GRU, reduces vanishing gradient)

# Mini-batching in RNNs

- Mini-batching makes things much faster!
- But mini-batching in RNNs is harder than in feed-forward networks
  - Each word depends on the previous word
  - Sequences are of various length

- Padding: 

this	is	an	example	</s>
this	is	another	</s>	<b>&lt;/s&gt;</b>

- If we use sentences of different lengths, too much padding and sorting can **result in decreased performance**
- To remedy this: **sort sentences** so similarly-lengthed seqs are in the same batch

# Mini-batching in RNNs

- Many alternatives:
  1. Shuffle the corpus randomly before creating mini-batches (with no sorting).
  2. Sort based on the source sequence length.
  3. Sort based on the target sequence length.
  4. Sort using the source sequence length, break ties by sorting by target sequence length.
  5. Sort using the target sequence length, break ties by sorting by source sequence length.

---

**Algorithm 1** Create mini-batches

---

```
1:  $\mathbf{C} \leftarrow$  Training corpus
2:  $\mathbf{C} \leftarrow \text{sort}(\mathbf{C})$  or  $\text{shuffle}(\mathbf{C})$   $\triangleright$  sort or shuffle
   the whole corpus
3:  $\mathbf{B} \leftarrow \{\}$   $\triangleright$  mini-batches
4:  $i \leftarrow 0, j \leftarrow 0$ 
5: while  $i < \mathbf{C}.\text{size}()$  do
6:    $\mathbf{B}[j] \leftarrow \mathbf{B}[j] + \mathbf{C}[i]$ 
7:   if  $\mathbf{B}[j].\text{size}() \geq \text{max mini-batch size}$  then
8:      $\mathbf{B}[j] \leftarrow \text{padding}(\mathbf{B}[j])$   $\triangleright$ 
       Padding tokens to the longest sentence in the
       mini-batch
9:      $j \leftarrow j + 1$ 
10:   end if
11:    $i \leftarrow i + 1$ 
12: end while
13:  $\mathbf{B} \leftarrow \text{shuffle}(\mathbf{B})$   $\triangleright$  shuffle the order of the
    mini-batches
```

     $\hat{\mathbf{g}} \leftarrow \frac{\text{threshold}}{\|\hat{\mathbf{g}}\|} \hat{\mathbf{g}}$   
end if
```

[Recurrent neural network regularization. Zaremba et al., arXiv 2014.](#)

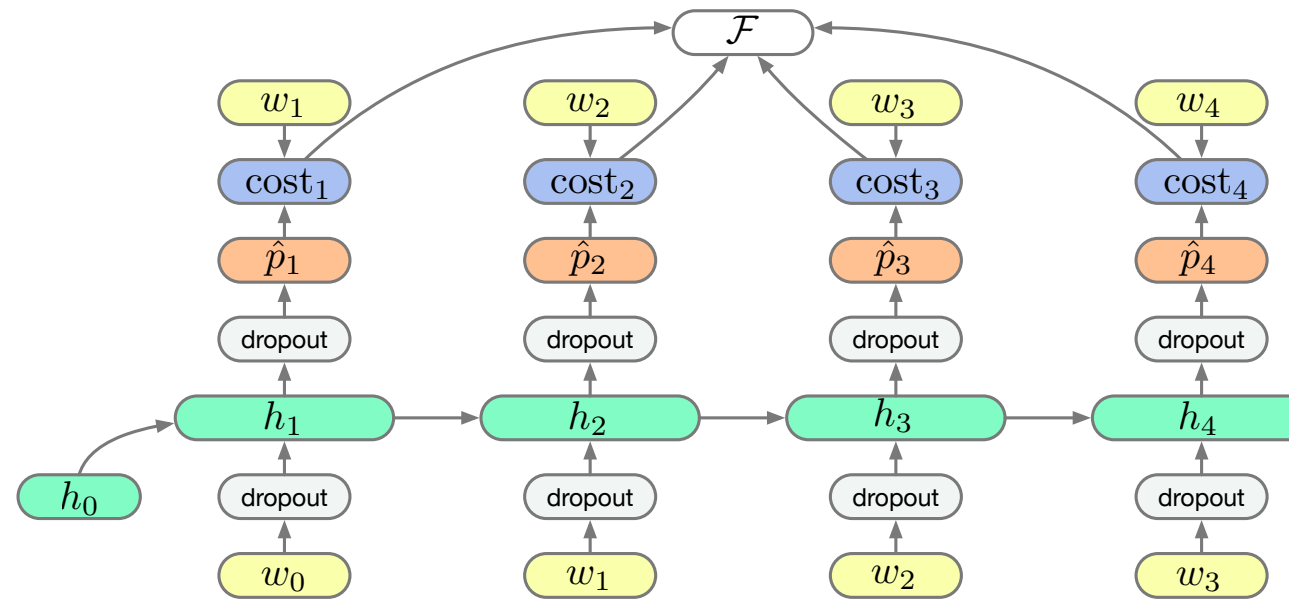

# Regularization: Dropout

- Large recurrent networks often overfit their training data by memorizing the sequences observed. Such models generalize poorly to novel sequences.
- A common approach in Deep Learning is to overparametrize a model, such that it could easily memorize the training data, and then heavily regularize it to facilitate generalization.
- The regularization method of choice is often Dropout.

# Regularization: Dropout

- Dropout is ineffective when applied to recurrent connections, as repeated random masks zero all hidden units in the limit.
- The most common solution is to only apply dropout to non-recurrent connections

# Regularization: Dropout

- A Better Solution: Use the **same dropout mask** at **each time step** for both inputs, outputs, and recurrent layers.

(a) Naive dropout RNN

(b) Variational RNN

Each square represents an RNN unit, with horizontal arrows representing recurrent connections. Vertical arrows represent the input and output to each RNN unit. Coloured connections represent dropped-out inputs, with different colours corresponding to different dropout masks. Dashed lines correspond to standard connections with no dropout.

# Regularization: Norm-stabilizer

- Stabilize the activations of RNNs by penalizing the squared distance between successive hidden states' norms

$$\beta \frac{1}{T} \sum_{t=1}^T (\|h_t\|_2 - \|h_{t-1}\|_2)^2$$

- Enforce the norms of the hidden layer activations approximately constant across time

# Regularization: Layer Normalization

- Similar to batch normalization
- Computes the normalization statistics separately at each time step
- Effective for stabilizing the hidden state dynamics in RNNs
- Reduces training time

$$\mathbf{h}^t = f \left[ \frac{\mathbf{g}}{\sigma^t} \odot (\mathbf{a}^t - \mu^t) + \mathbf{b} \right]$$

$$\mu^t = \frac{1}{H} \sum_{i=1}^H a_i^t$$

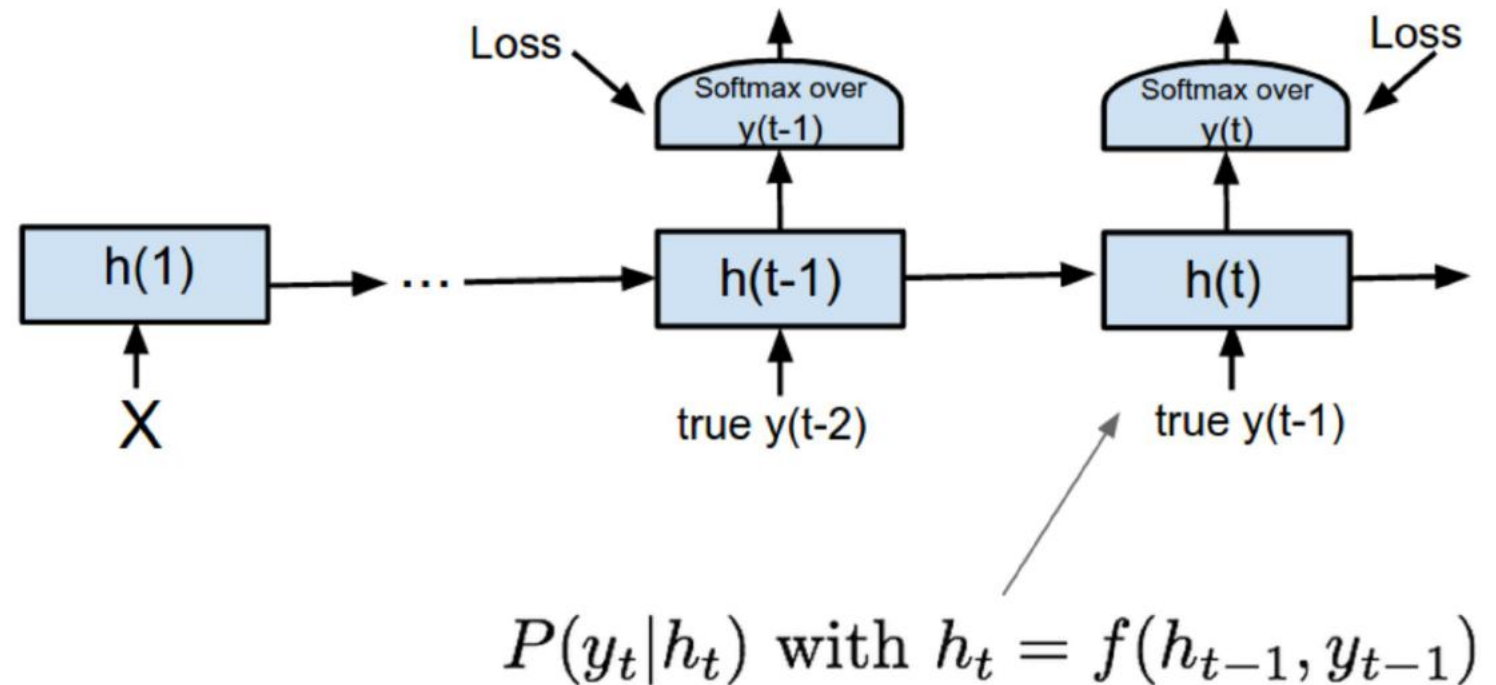

$$\sigma^t = \sqrt{\frac{1}{H} \sum_{i=1}^H (a_i^t - \mu^t)^2}$$

Layer Normalization [Ba, Kiros & Hinton, 2016]

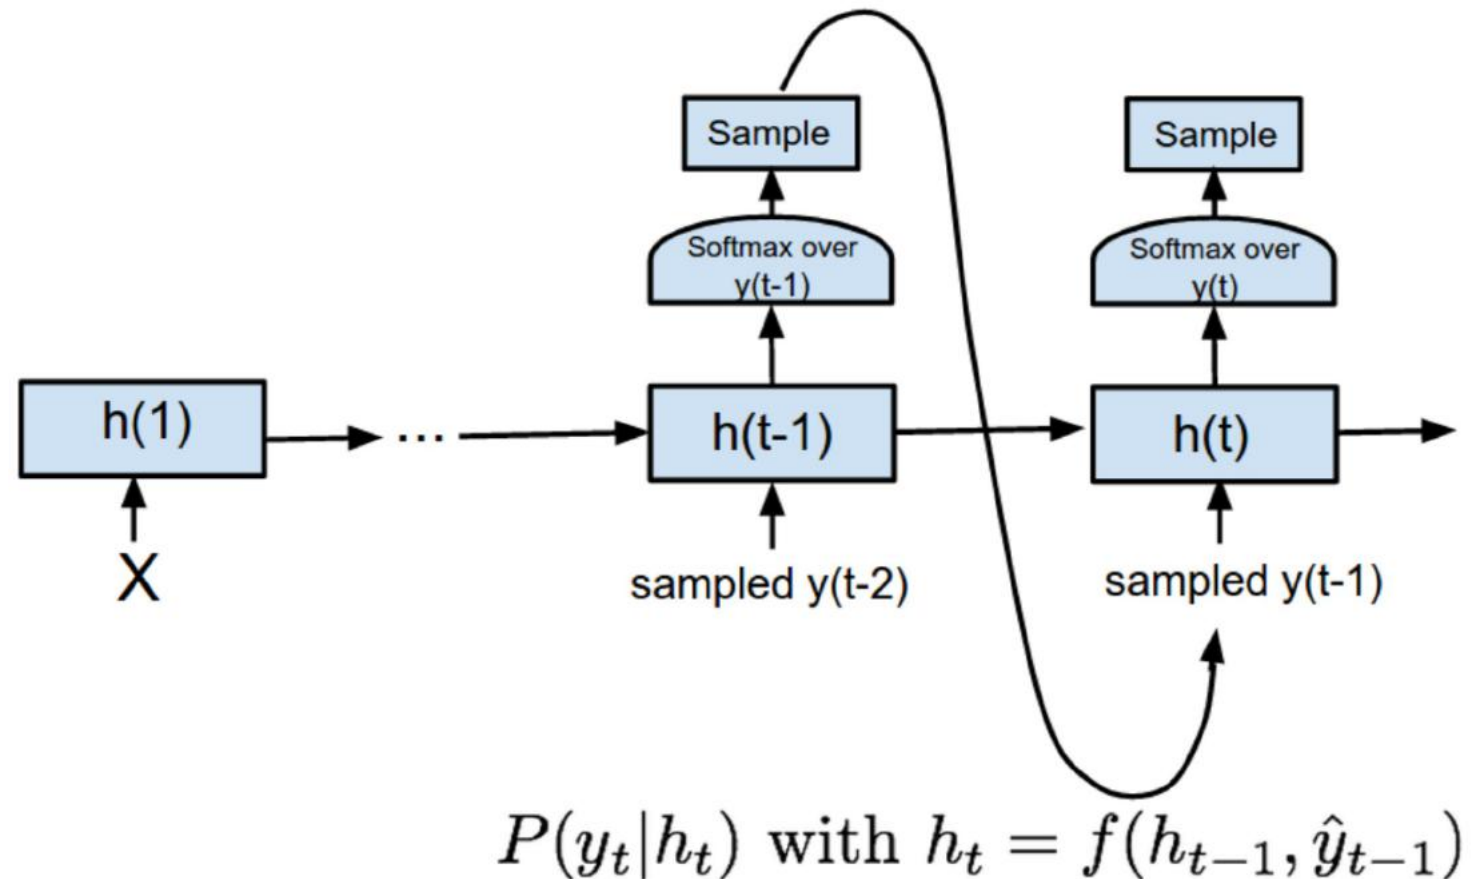

# Scheduled Sampling

- “change the training process from a fully guided scheme using the true previous token, towards a less guided scheme which mostly uses the generated token instead.”

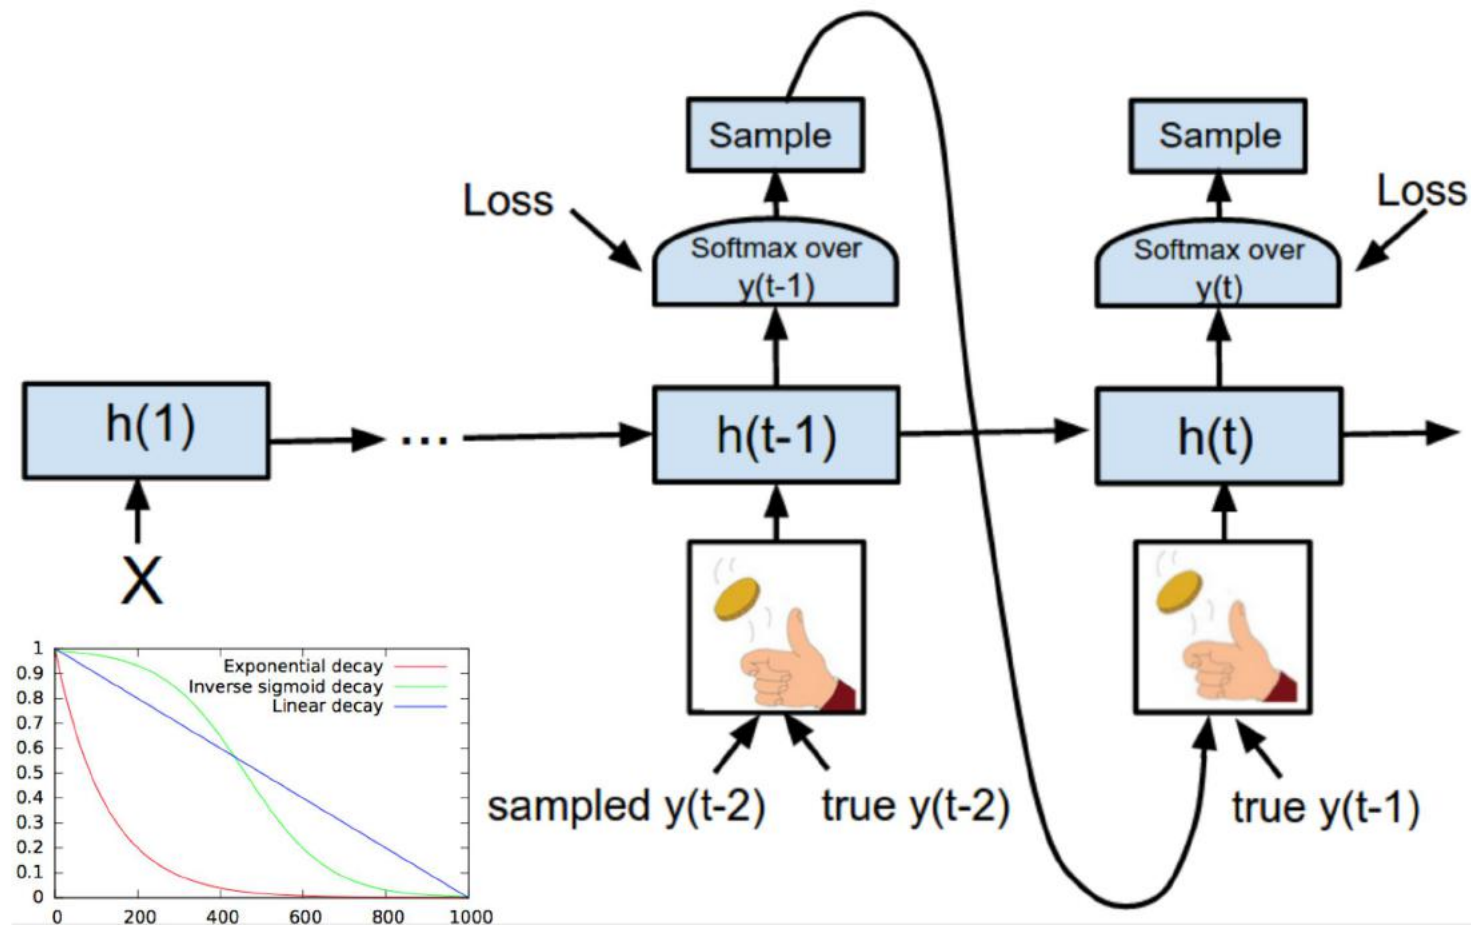

# Scheduled Sampling

- “change the training process from a fully guided scheme using the true previous token, towards a less guided scheme which mostly uses the generated token instead.”
- During training, randomly replace a **conditioning** ground truth token by the model's previous prediction

# Scheduled Sampling

- “change the training process from a fully guided scheme using the true previous token, towards a less guided scheme which mostly uses the generated token instead.”
- During training, randomly replace a **conditioning** ground truth token by the model's previous prediction

# Gated Cells

- rather than each node being just a simple RNN cell, make each node a more **complex unit with gates** controlling what information is passed through

RNN

vs

LSTM, GRU, etc

**Long short term memory** cells are able to keep track of information throughout many timesteps.

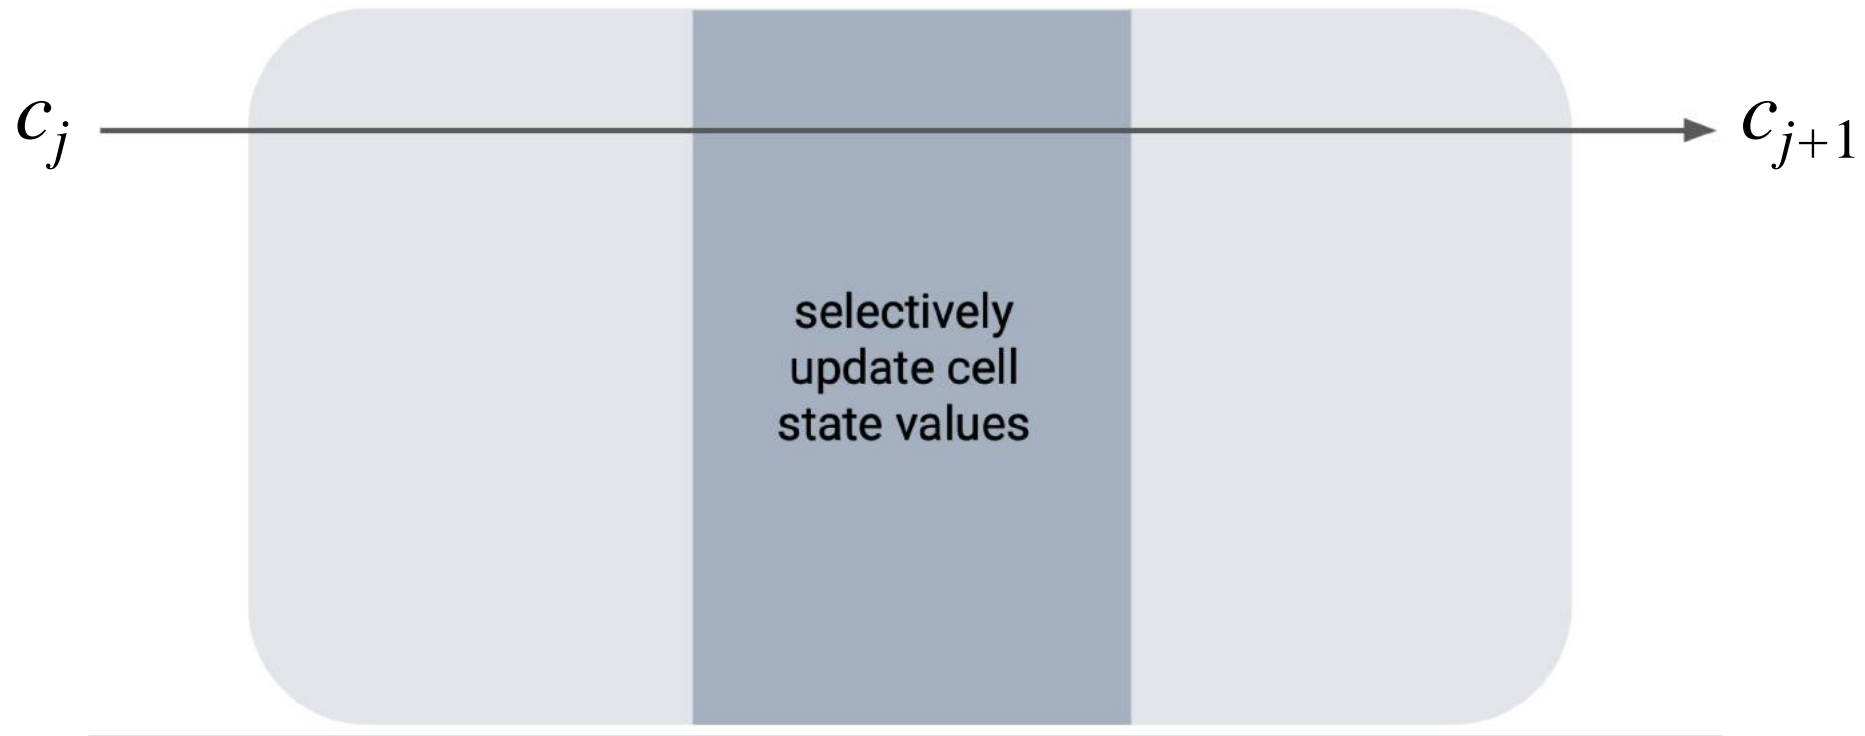

# Long Short-Term Memory (LSTM)

# The LSTM Idea

\* Dashed line indicates time-lag

$$c_t = c_{t-1} + \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$
$$h_t = \tanh c_t$$

# The Original LSTM Cell

$$c_t = c_{t-1} + i_t \otimes \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

$$h_t = o_t \otimes \tanh c_t$$

$$i_t = \sigma \left( W_i \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_i \right)$$

Similarly for  $o_t$

# The Popular LSTM Cell

$$i_t = \sigma \left( W_i \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_i \right)$$

$$c_t = f_t \otimes c_{t-1} + i_t \otimes \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = o_t \otimes \tanh c_t$$

# The Popular LSTM Cell

$$i_t = \sigma \left( W_i \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_i \right)$$

$$c_t = f_t \otimes c_{t-1} + i_t \otimes \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = o_t \otimes \tanh c_t$$

**forget gate** decides what information is going to be thrown away from the cell state

# The Popular LSTM Cell

$$i_t = \sigma \left( W_i \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_i \right)$$

$$c_t = f_t \otimes c_{t-1} + i_t \otimes \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = o_t \otimes \tanh c_t$$

**input gate** and **a tanh layer** decides what information is going to be stored in the cell state

# The Popular LSTM Cell

$$i_t = \sigma \left( W_i \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_i \right)$$

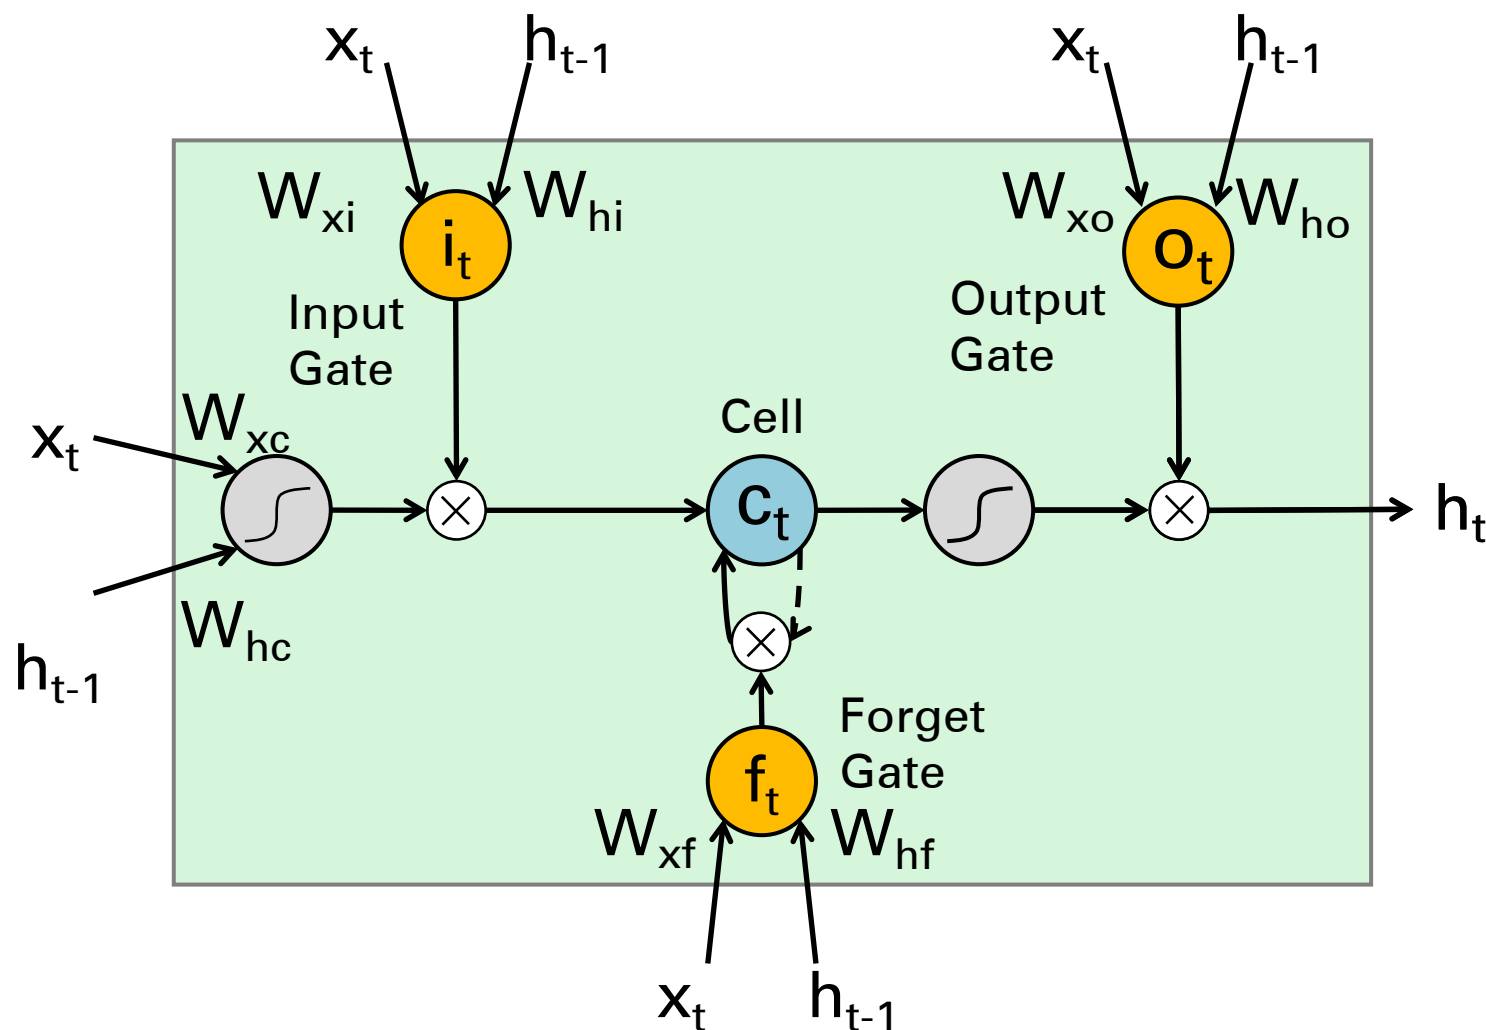

$$c_t = f_t \otimes c_{t-1} + i_t \otimes \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = o_t \otimes \tanh c_t$$

Update the old cell state with the new one.

# The Popular LSTM Cell

$$i_t = \sigma \left( W_i \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_i \right)$$

$$c_t = f_t \otimes c_{t-1} + i_t \otimes \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

input gate	forget gate	behavior
0	1	remember the previous value
1	1	add to the previous value
0	0	erase the value
1	0	overwrite the value

# The Popular LSTM Cell

$$i_t = \sigma \left( W_i \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_i \right)$$

$$c_t = f_t \otimes c_{t-1} + i_t \otimes \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = o_t \otimes \tanh c_t$$

$$o_t = \sigma \left( W_o \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_o \right)$$

**Output gate** decides what is going to be outputted. The final output is based on cell state and output of sigmoid gate.

# LSTM – Forward/Backward

Illustrated LSTM Forward and Backward Pass

<http://arunmallya.github.io/writeups/nn/lstm/index.html>

# LSTM variants

# The Popular LSTM Cell

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

Similarly for  $i_t$ ,  $o_t$

$$c_t = f_t \otimes c_{t-1} + i_t \otimes \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

$$h_t = o_t \otimes \tanh c_t$$

\* Dashed line indicates time-lag

# Extension I: Peephole LSTM

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \\ c_{t-1} \end{pmatrix} + b_f \right)$$

Similarly for  $i_t, o_t$  (uses  $c_t$ )

$$c_t = f_t \otimes c_{t-1} + i_t \otimes \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

$$h_t = o_t \otimes \tanh c_t$$

- Add **peephole connections**.
- All gate layers look at the cell state!

\* Dashed line indicates time-lag

# Other minor variants

- Coupled Input and Forget Gate  $f_t = 1 - i_t$

- Full Gate Recurrence

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \\ c_{t-1} \\ i_{t-1} \\ f_{t-1} \\ o_{t-1} \end{pmatrix} + b_f \right)$$

# LSTM: A Search Space Odyssey

- Tested the following variants, using Peephole LSTM as standard:
  1. No Input Gate (NIG)
  2. No Forget Gate (NFG)
  3. No Output Gate (NOG)
  4. No Input Activation Function (NIAF)
  5. No Output Activation Function (NOAF)
  6. No Peepholes (NP)
  7. Coupled Input and Forget Gate (CIFG)
  8. Full Gate Recurrence (FGR)
- On the tasks of:
  - Timit Speech Recognition: Audio frame to 1 of 61 phonemes
  - IAM Online Handwriting Recognition: Sketch to characters
  - JSB Chorales: Next-step music frame prediction

# LSTM: A Search Space Odyssey

- The standard LSTM performed reasonably well on multiple datasets and none of the modifications significantly improved the performance
- Coupling gates and removing peephole connections simplified the LSTM without hurting performance much
- The forget gate and output activation are crucial
- Found interaction between learning rate and network size to be minimal – indicates calibration can be done using a small network first

# Gated Recurrent Unit

# Gated Recurrent Unit (GRU)

- A very simplified version of the LSTM
  - Merges forget and input gate into a single 'update' gate
  - Merges cell and hidden state
- Has fewer parameters than an LSTM and has been shown to outperform LSTM on some tasks

[Learning Phrase Representations using RNN Encoder-Decoder for Statistical Machine Translation](#)  
[\[Cho et al., 14\]](#)

# GRU

$$r_t = \sigma \left( W_r \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h'_t = \tanh W \begin{pmatrix} x_t \\ r_t \otimes h_{t-1} \end{pmatrix}$$

$$z_t = \sigma \left( W_z \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = (1 - z_t) \otimes h_{t-1} + z_t \otimes h'_t$$

# GRU

$$r_t = \sigma \left( W_r \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

computes a **reset gate** based on current input and hidden state

# GRU

$$r_t = \sigma \left( W_r \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h'_t = \tanh W \begin{pmatrix} x_t \\ r_t \otimes h_{t-1} \end{pmatrix}$$

computes the **hidden state** based on current input and hidden state

if reset gate unit is  $\sim 0$ , then this ignores previous memory and only stores the new input information

# GRU

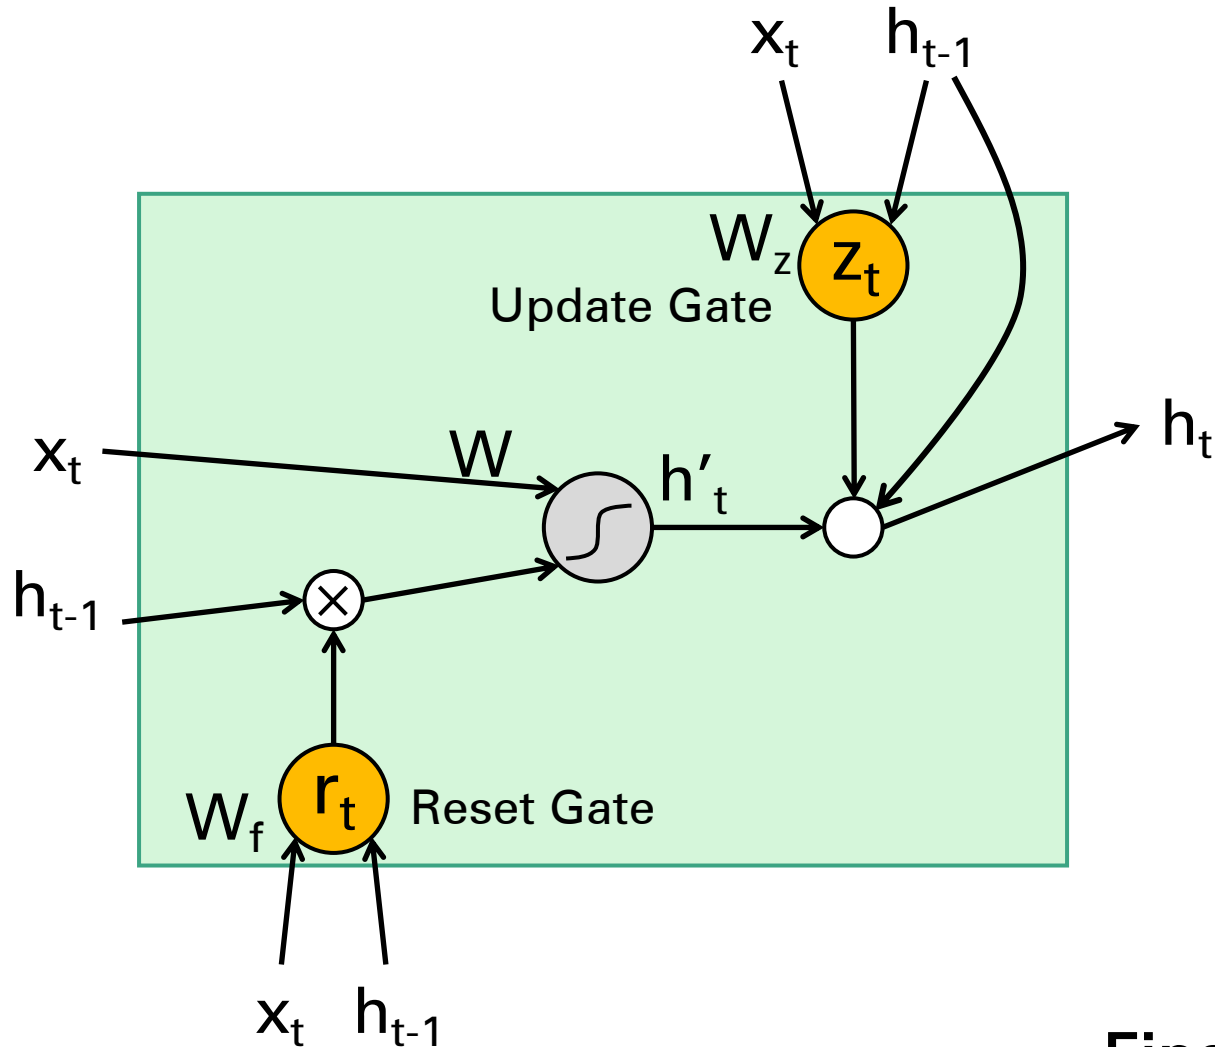

$$r_t = \sigma \left( W_r \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h'_t = \tanh W \begin{pmatrix} x_t \\ r_t \otimes h_{t-1} \end{pmatrix}$$

$$z_t = \sigma \left( W_z \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

computes an **update gate** again based on current input and hidden state

# GRU

$$r_t = \sigma \left( W_r \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h'_t = \tanh W \begin{pmatrix} x_t \\ r_t \otimes h_{t-1} \end{pmatrix}$$

$$z_t = \sigma \left( W_z \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = (1 - z_t) \otimes h_{t-1} + z_t \otimes h'_t$$

**Final memory** at timestep  $t$  combines both current and previous timesteps

# GRU Intuition

$$r_t = \sigma \left( W_r \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h'_t = \tanh W \begin{pmatrix} x_t \\ r_t \otimes h_{t-1} \end{pmatrix}$$

$$z_t = \sigma \left( W_z \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = (1 - z_t) \otimes h_{t-1} + z_t \otimes h'_t$$

- If reset is close to 0, ignore previous hidden state
  - Allows model to drop information that is irrelevant in the future
- Update gate  $z$  controls how much of past state should matter now.
  - If  $z$  close to 1, then we can copy information in that unit through many time steps! **Less vanishing gradient!**
- Units with short-term dependencies often have reset gates very active

# An Empirical Exploration of Recurrent Network Architectures

- Given the rather ad-hoc design of the LSTM, the authors try to determine if the architecture of the LSTM is optimal
- They use an evolutionary search for better architectures

# Evolutionary Architecture Search

- A list of top-100 architectures so far is maintained, initialized with the LSTM and the GRU
- The GRU is considered as the baseline to beat
- New architectures are proposed, and retained based on performance ratio with GRU
- All architectures are evaluated on 3 problems
  - Arithmetic: Compute digits of sum or difference of two numbers provided as inputs. Inputs have distractors to increase difficulty  
 $3e36d9-h1h39f94eeh43keg3c = 3369 - 13994433 = -13991064$
  - XML Modeling: Predict next character in valid XML modeling
  - Penn Tree-Bank Language Modeling: Predict distributions over words

# Evolutionary Architecture Search

- At each step
  - Select 1 architecture at random, evaluate on 20 randomly chosen hyperparam settings.
  - Alternatively, propose a new architecture by mutating an existing one. Choose prob.  $p$  from  $[0,1]$  uniformly and apply a transformation to each node with prob.  $p$ 
    - If node is a non-linearity, replace with  $\{\tanh(x), \text{sigmoid}(x), \text{ReLU}(x), \text{Linear}(0, x), \text{Linear}(1, x), \text{Linear}(0.9, x), \text{Linear}(1.1, x)\}$
    - If node is an elementwise op, replace with  $\{\text{multiplication}, \text{addition}, \text{subtraction}\}$
    - Insert random activation function between node and one of its parents
    - Replace node with one of its ancestors (remove node)
    - Randomly select a node (node A). Replace the current node with either the sum, product, or difference of a random ancestor of the current node and a random ancestor of A.
  - Add architecture to list based on minimum relative accuracy wrt GRU on 3 different tasks

[An Empirical Exploration of Recurrent Network Architectures \[Jozefowicz et al., 2015\]](#)

# Evolutionary Architecture Search

- 3 novel architectures are presented in the paper
- Very similar to GRU, but slightly outperform it
- **LSTM initialized with a large positive forget gate bias outperformed both the basic LSTM and the GRU!**

# LSTM initialized with large positive forget gate bias?

- Recall

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$c_t = f_t \otimes c_{t-1} + i_t \otimes \tanh W \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix}$$

$$\delta c_{t-1} = \delta c_t \otimes f_t$$

- Gradients will vanish if  $f$  is close to 0. Using a large positive bias ensures that  $f$  has values close to 1, especially when training begins
- Helps learn long-range dependencies
- Originally stated in [Learning to forget: Continual prediction with LSTM \[Gers et al., 2000\]](#), but forgotten over time

# LSTMs and GRUs

## Good

- Careful initialization and optimization of vanilla RNNs can enable them to learn long(ish) dependencies, but gated additive cells, like the LSTM and GRU, often just work.

## Bad

- LSTMs and GRUs have considerably more parameters and computation per memory cell than a vanilla RNN, as such they have less memory capacity per parameter\*

An LSTM with large positive forget gate bias works best!

\*Capacity and Trainability in Recurrent Neural Networks. [Collins et al., arXiv 2016]
