# COMP547 DEEP UNSUPERVISED LEARNING

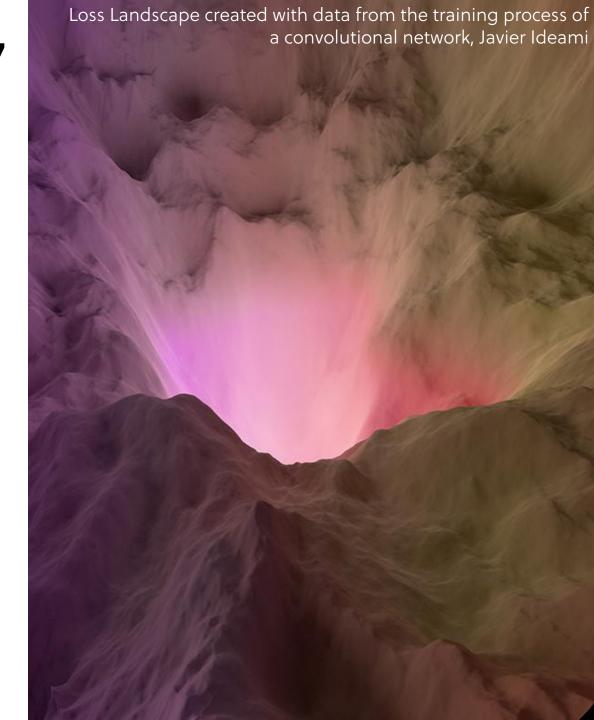

Lecture #3 – Neural Networks Basics II: Sequential Processing with NNs

Aykut Erdem // Koç University // Spring 2021

# Previously on COMP547

- deep learning
- computation in a neural net
- optimization
- backpropagation
- training tricks
- convolutional neural networks

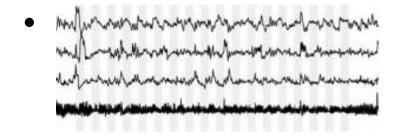

#### Lecture overview

- sequence modeling
- recurrent neural networks (RNNs)
- language modeling with RNNs
- how to train RNNs
- long short-term memory (LSTM)
- gated recurrent unit (GRU)

- Disclaimer: Much of the material and slides for this lecture were borrowed from
  - —Bill Freeman, Antonio Torralba and Phillip Isola's MIT 6.869 class
  - —Phil Blunsom's Oxford Deep NLP class
  - —Fei-Fei Li, Andrej Karpathy and Justin Johnson's CS231n class
  - —Arun Mallya's tutorial on Recurrent Neural Networks

## Sequential data

• "I took the dog for a walk this morning." sentence

medical signals

speech waveform

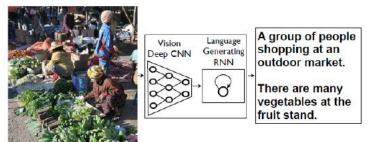

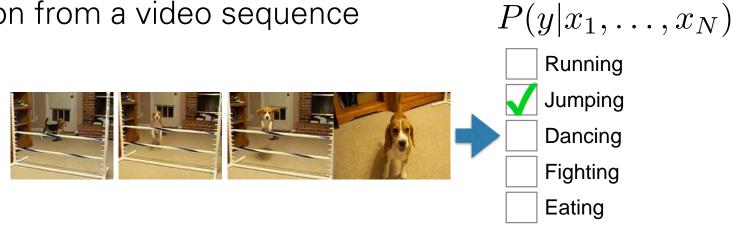

video frames

# Modeling sequential data

- Sample data sequences from a certain distribution  $P(x_1,\ldots,x_N)$
- Generate natural sentences to describe an image  $P(y_1,\ldots,y_M|I)$

• Activity recognition from a video sequence

# Modeling sequential data

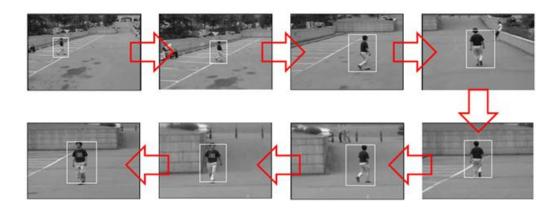

Speech recognition

$$P(y_1,\ldots,y_N|x_1,\ldots,x_N)$$

Object tracking

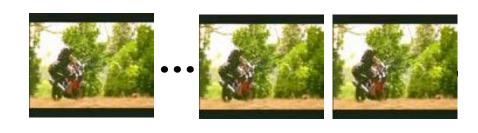

$$P(y_1,\ldots,y_N|x_1,\ldots,x_N)$$

# Modeling sequential data

Generate natural sentences to describe a video

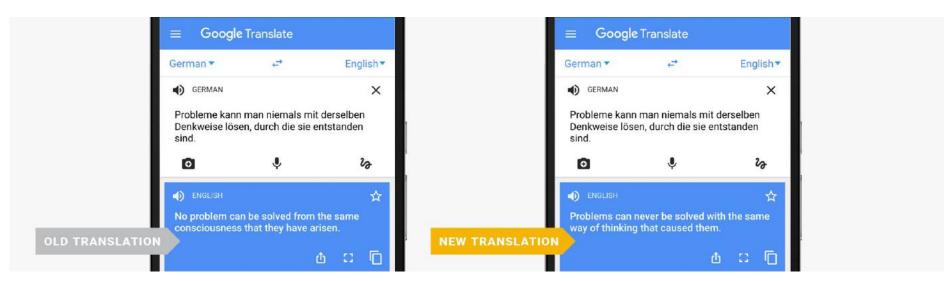

$$P(y_1,\ldots,y_M|x_1,\ldots,x_N)$$

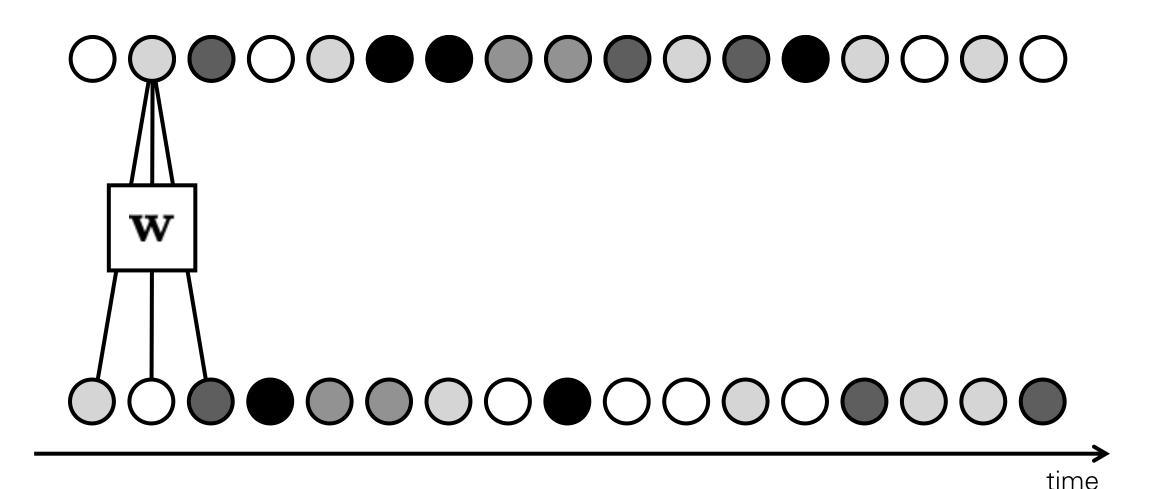

#### → A man is riding a bike

Machine translation

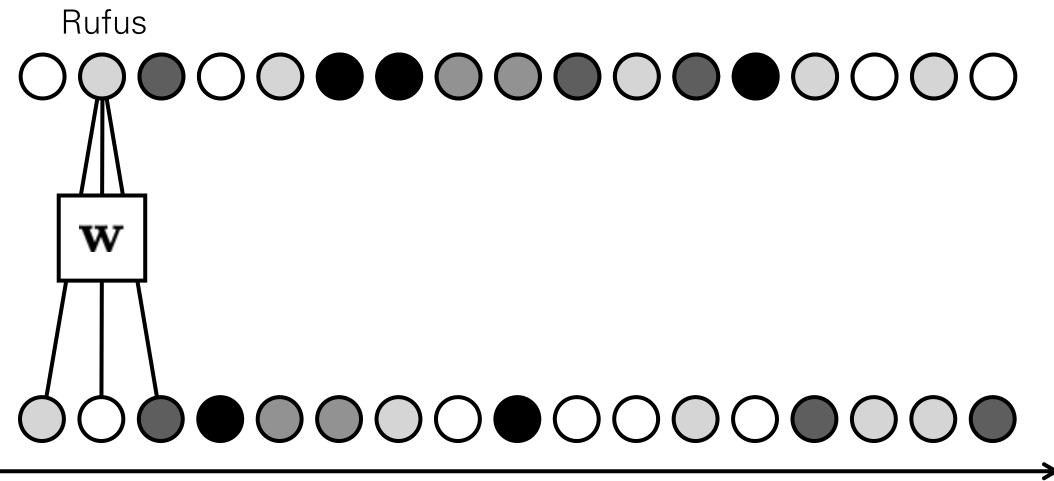

#### Convolutions in time

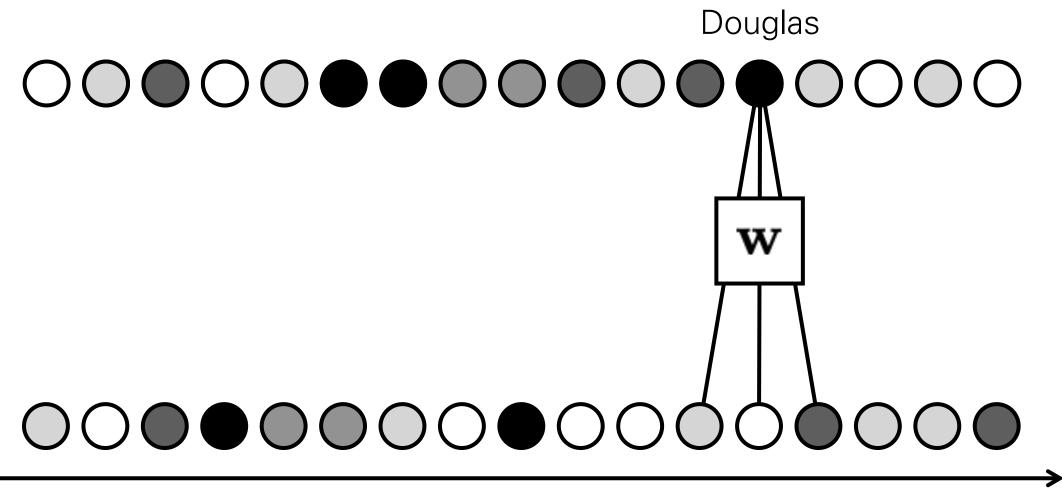

time

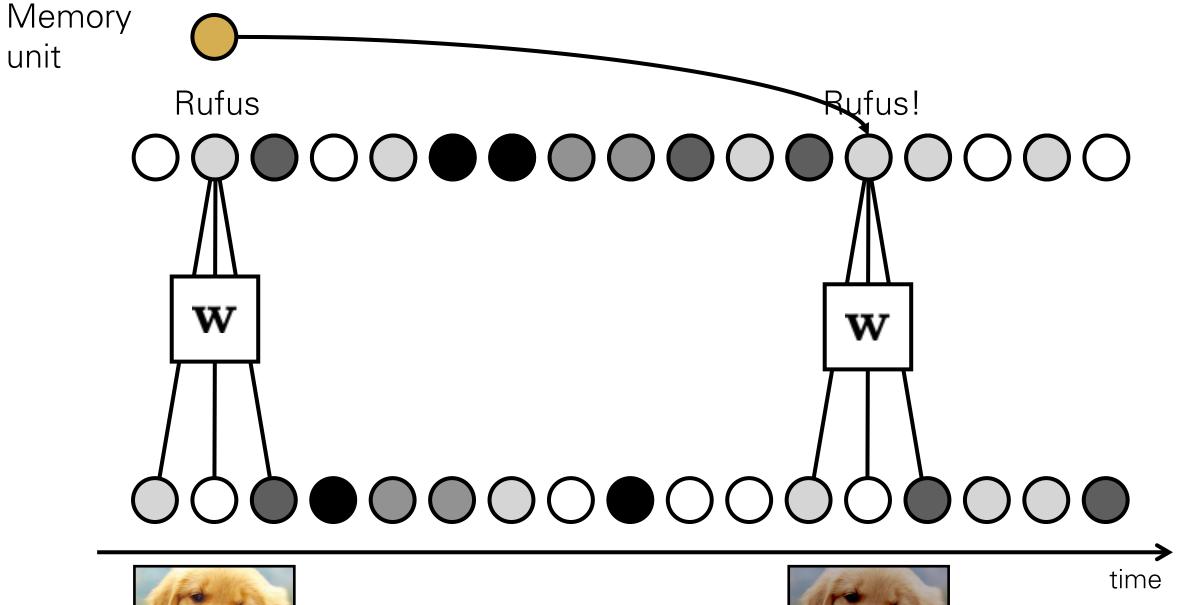

time

Memory unit Rufus 

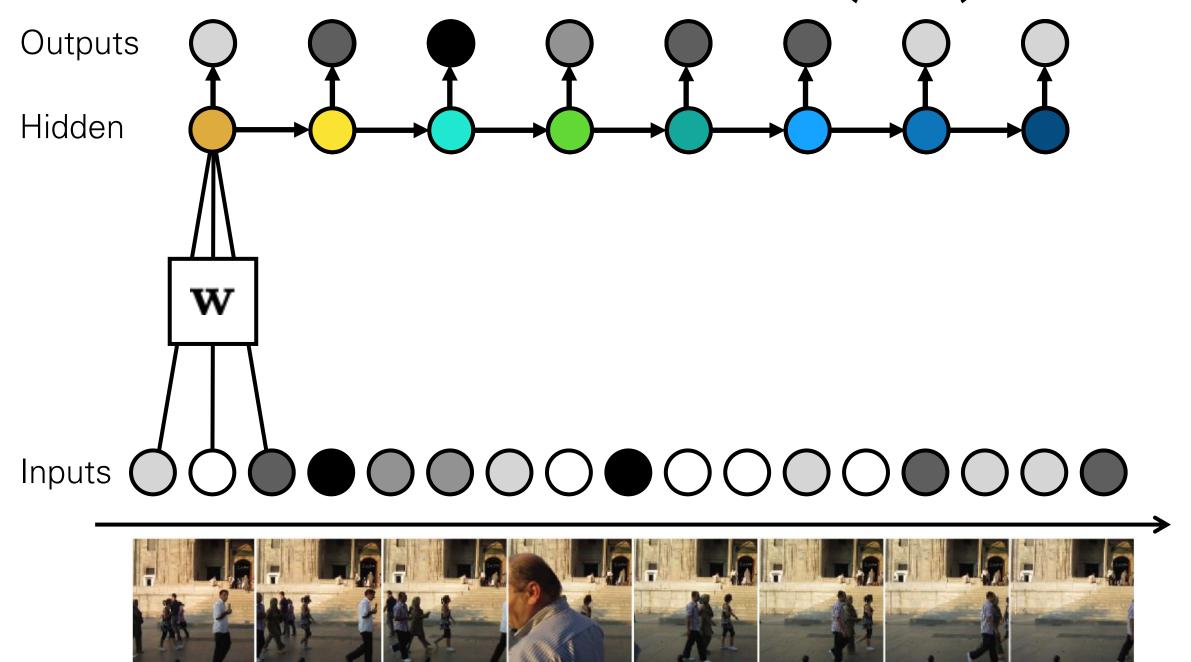

time

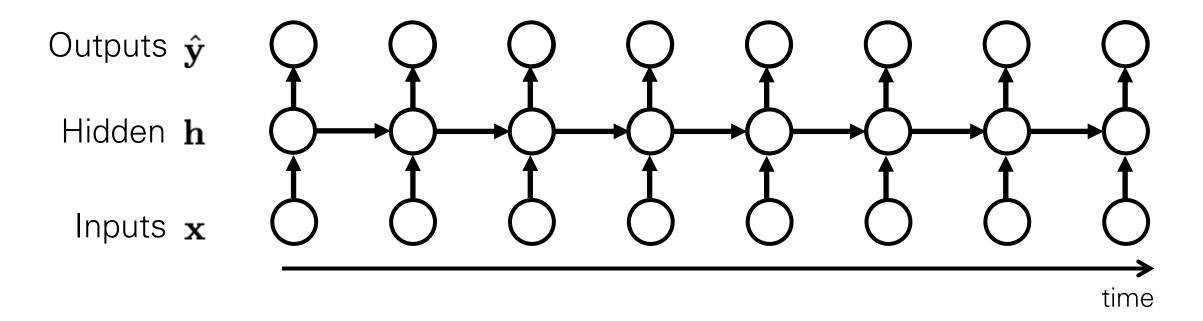

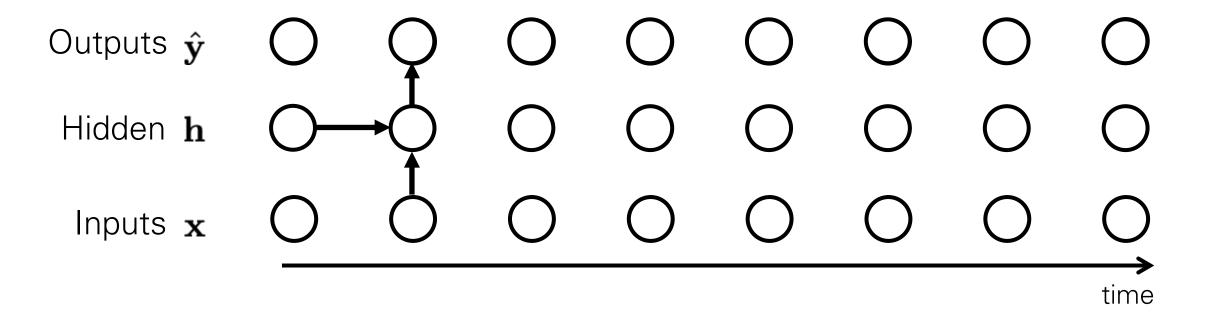

#### To model sequences, we need

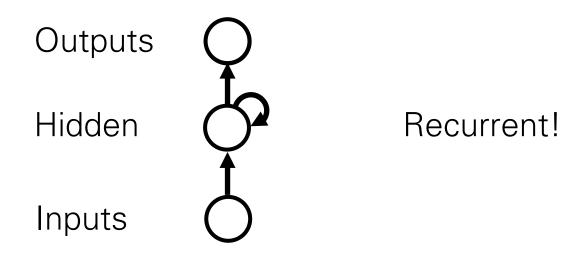

- 1. to deal with variable length sequences
- 2. to maintain sequence order
- 3. to keep track of long-term dependencies
- 4. to share parameters across the sequence

# Recurrent Neural Networks

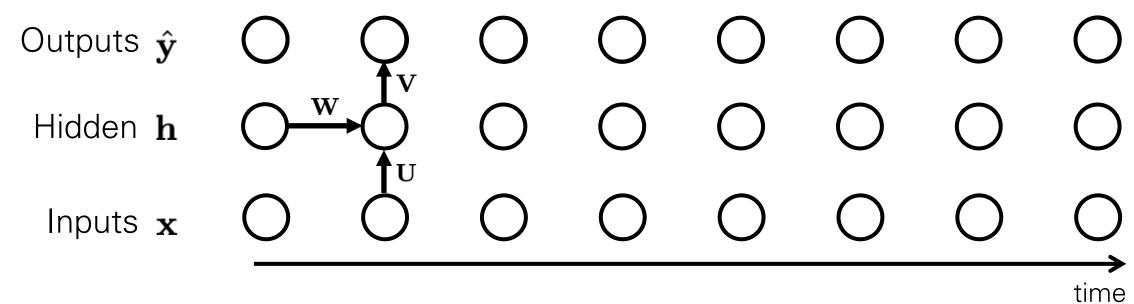

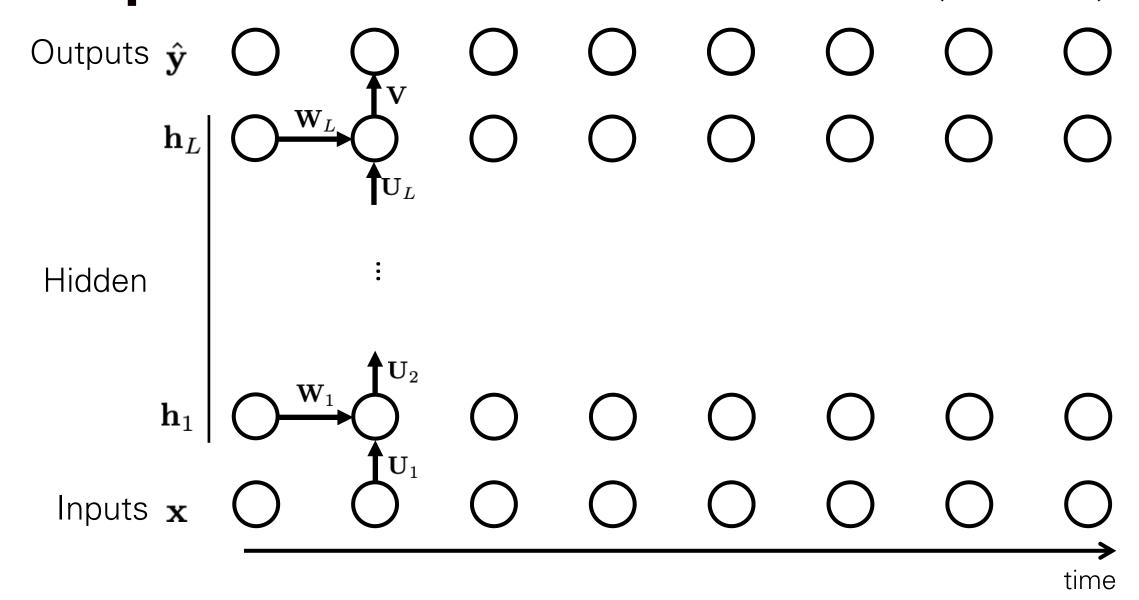

$$\mathbf{h}^{(t)} = f(\mathbf{h}^{(t-1)}, \mathbf{x}^{(t)})$$
$$\mathbf{y}^{(t)} = g(\mathbf{h}^{(t)})$$

$$\mathbf{h}^{(t)} = f(\mathbf{h}^{(t-1)}, \mathbf{x}^{(t)})$$
$$\mathbf{y}^{(t)} = g(\mathbf{h}^{(t)})$$

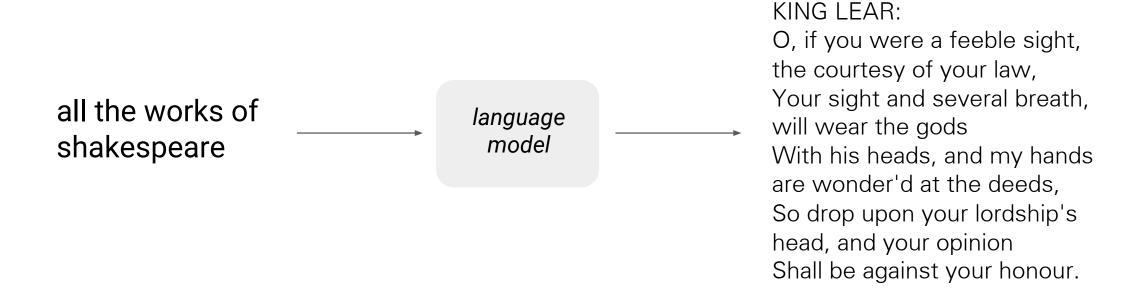

$$\mathbf{a}^{(t)} = \mathbf{W}\mathbf{h}^{(t-1)} + \mathbf{U}\mathbf{x}^{(t)} + \mathbf{b}$$
 $\mathbf{h}^{(t)} = \tanh(\mathbf{a}^{(t)})$ 
 $\mathbf{o}^{(t)} = \mathbf{V}\mathbf{h}^{(t)} + \mathbf{c}$ 
 $\hat{\mathbf{y}}^{(t)} = \mathtt{softmax}(\mathbf{o}^{(t)})$ 

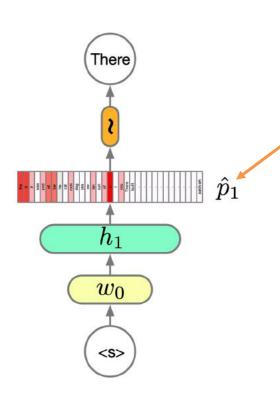

# Language Modeling

## Language modeling

• Language models aim to represent the history of observed text  $(w_1,...,w_{t-1})$  succinctly in order to predict the next word  $(w_t)$ :

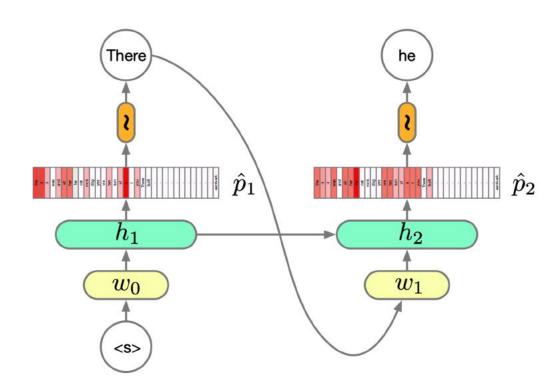

$$h_n = g(V[x_n; h_{n-1}] + c)$$
$$\hat{y}_n = Wh_n + b$$

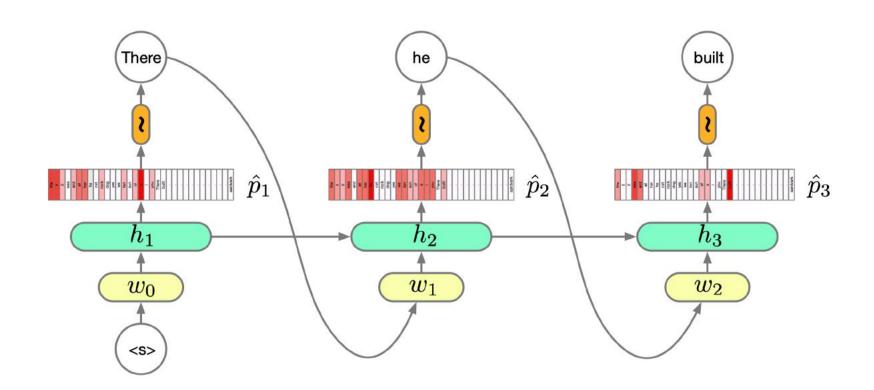

a probability distribution over possible next words, aka a softmax

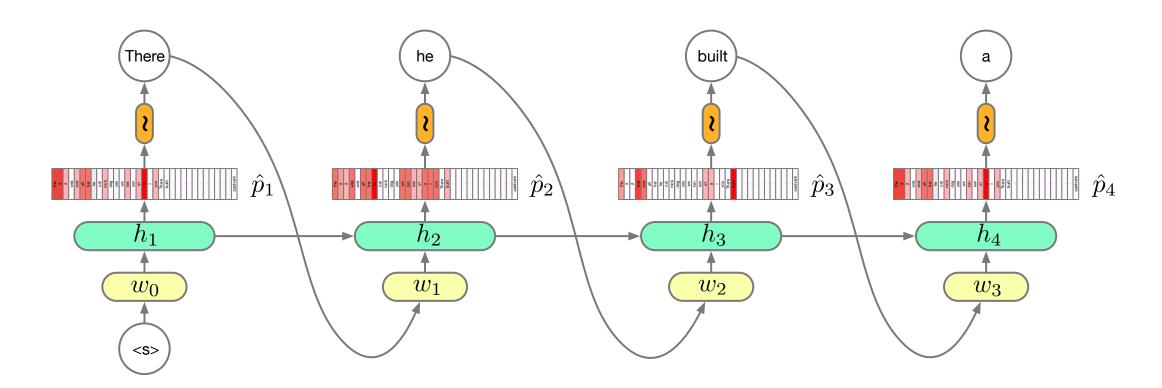

$$h_n = g(V[x_n; h_{n-1}] + c)$$
$$\hat{y}_n = Wh_n + b$$

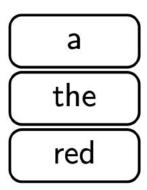

$$h_n = g(V[x_n; h_{n-1}] + c)$$
$$\hat{y}_n = Wh_n + b$$

$$h_n = g(V[x_n; h_{n-1}] + c)$$
$$\hat{y}_n = Wh_n + b$$

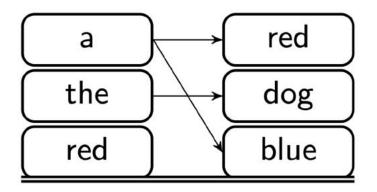

For t = 1...T:

For all k and for all possible output words w:

$$s(w, \hat{y}_{1:t-1}^{(k)}) \leftarrow \log p(\hat{y}_{1:t-1}^{(k)}|x) + \log p(w|\hat{y}_{1:t-1}^{(k)}, x)$$

$$\hat{y}_{1:t}^{(1:K)} \leftarrow \text{K-arg max } s(w, \hat{y}_{1:t-1}^{(k)})$$

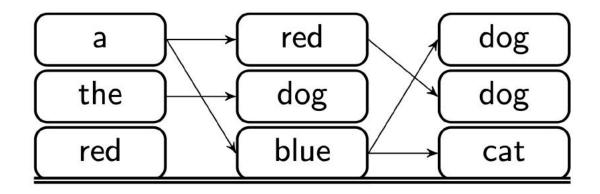

For t = 1...T:

For all k and for all possible output words w:

$$s(w, \hat{y}_{1:t-1}^{(k)}) \leftarrow \log p(\hat{y}_{1:t-1}^{(k)}|x) + \log p(w|\hat{y}_{1:t-1}^{(k)}, x)$$

$$\hat{y}_{1:t}^{(1:K)} \leftarrow \text{K-arg max } s(w, \hat{y}_{1:t-1}^{(k)})$$

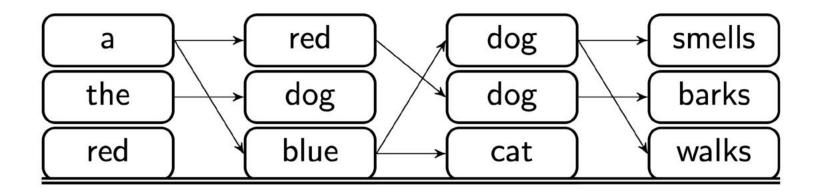

For t = 1...T:

For all k and for all possible output words w:

$$s(w, \hat{y}_{1:t-1}^{(k)}) \leftarrow \log p(\hat{y}_{1:t-1}^{(k)}|x) + \log p(w|\hat{y}_{1:t-1}^{(k)}, x)$$

$$\hat{y}_{1:t}^{(1:K)} \leftarrow \text{K-arg max } s(w, \hat{y}_{1:t-1}^{(k)})$$

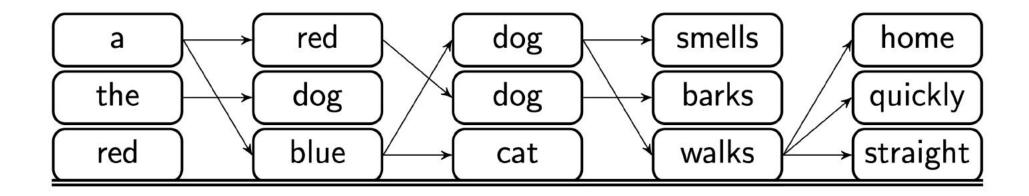

For t = 1...T:

For all k and for all possible output words w:

$$s(w, \hat{y}_{1:t-1}^{(k)}) \leftarrow \log p(\hat{y}_{1:t-1}^{(k)}|x) + \log p(w|\hat{y}_{1:t-1}^{(k)}, x)$$

$$\hat{y}_{1:t}^{(1:K)} \leftarrow \text{K-arg max } s(w, \hat{y}_{1:t-1}^{(k)})$$

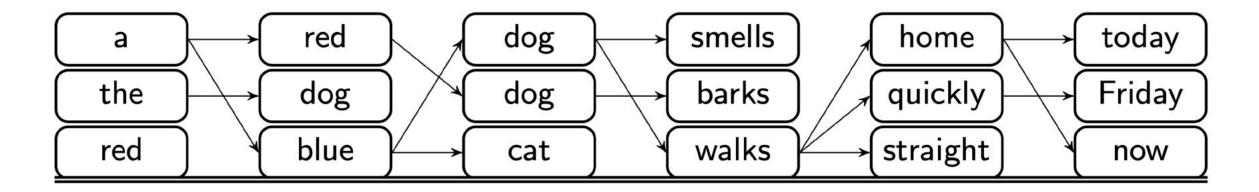

For t = 1...T:

Aftair fall unsuch that the hall for Prince Velzonski's that me of her hearly, and behs to so arwage fiving were to it beloge, pavu say falling misfort how, and Gogition is so overelical and ofter.

#### train more

"Why do what that day," replied Natasha, and wishing to himself the fact the princess, Princess Mary was easier, fed in had oftened him. Pierre aking his soul came to the packs and drove up his father-in-law women.

#### PANDARUS:

Alas, I think he shall be come approached and the day When little srain would be attain'd into being never fed, And who is but a chain and subjects of his death, I should not sleep.

#### Second Senator:

They are away this miseries, produced upon my soul, Breaking and strongly should be buried, when I perish The earth and thoughts of many states.

#### DUKE VINCENTIO:

Well, your wit is in the care of side and that.

#### Second Lord:

They would be ruled after this chamber, and my fair nues begun out of the fact, to be conveyed, Whose noble souls I'll have the heart of the wars.

#### Clown:

Come, sir, I will make did behold your worship.

#### VIOLA:

I'll drink it.

#### VIOLA:

Why, Salisbury must find his flesh and thought
That which I am not aps, not a man and in fire,
To show the reining of the raven and the wars
To grace my hand reproach within, and not a fair are hand,
That Caesar and my goodly father's world;
When I was heaven of presence and our fleets,
We spare with hours, but cut thy council I am great,
Murdered and by thy master's ready there
My power to give thee but so much as hell:
Some service in the noble bondman here,
Would show him to her wine.

#### KING LEAR:

O, if you were a feeble sight, the courtesy of your law, Your sight and several breath, will wear the gods With his heads, and my hands are wonder'd at the deeds, So drop upon your lordship's head, and your opinion Shall be against your honour.

## More Language Modeling Fun – Generating Super Mario Levels

Original Level:

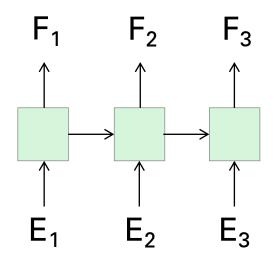

A level generated by a RNN:

### Is this enough?

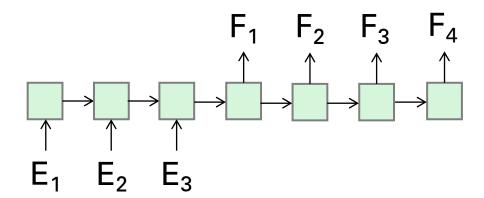

- Consider the problem of translation of English to French
- E.g. What is your name → Comment tu t'appelle
- Is the below architecture suitable for this problem?

 No, sentences might be of different length and words might not align. Need to see entire sentence before translating

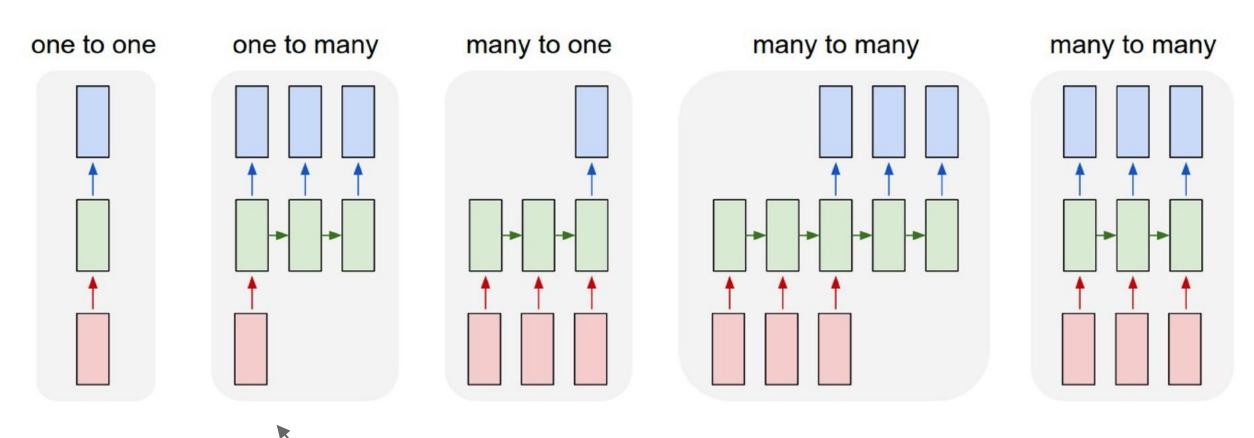

### Encoder-decoder seq2seq model

- Consider the problem of translation of English to French
- E.g. What is your name → Comment tu t'appelle
- Sentences might be of different length and words might not align.
   Need to see entire sentence before translating

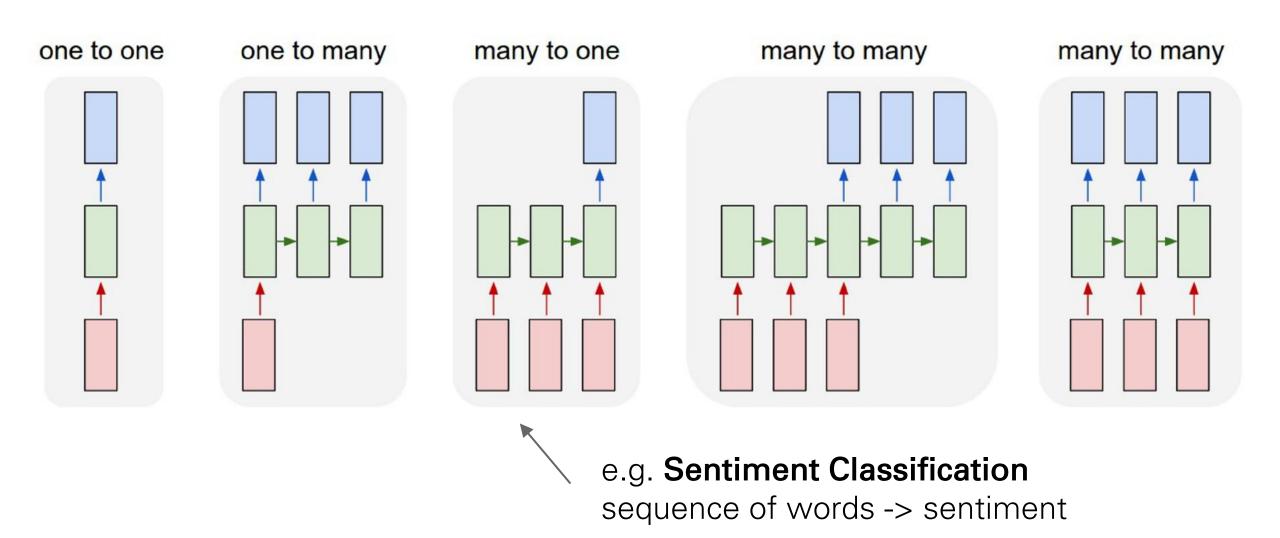

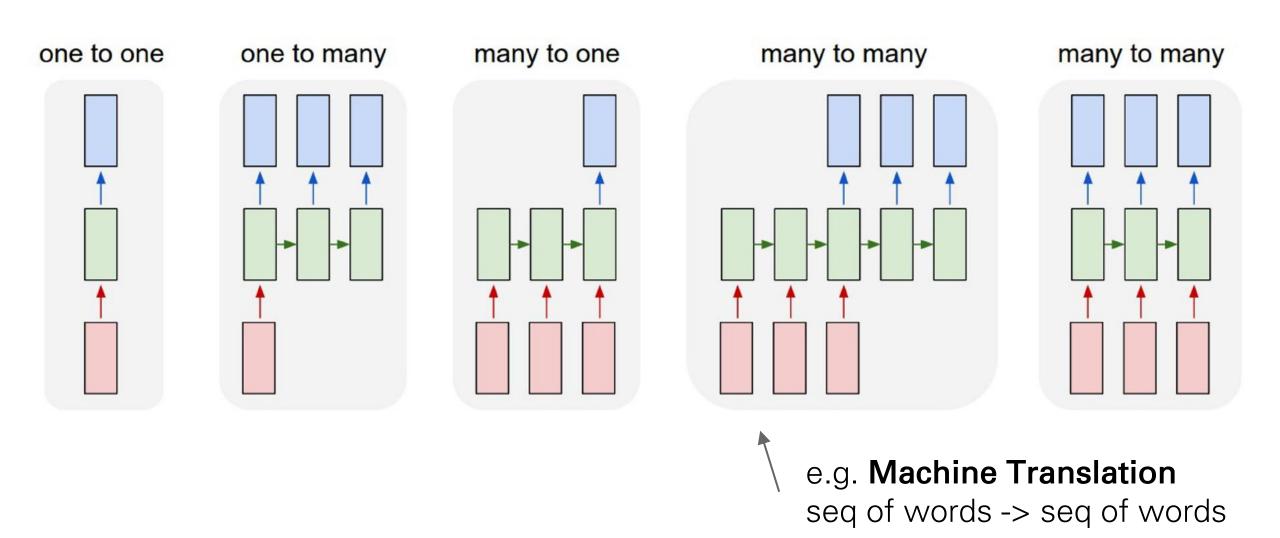

• Input-Output nature depends on the structure of the problem at hand

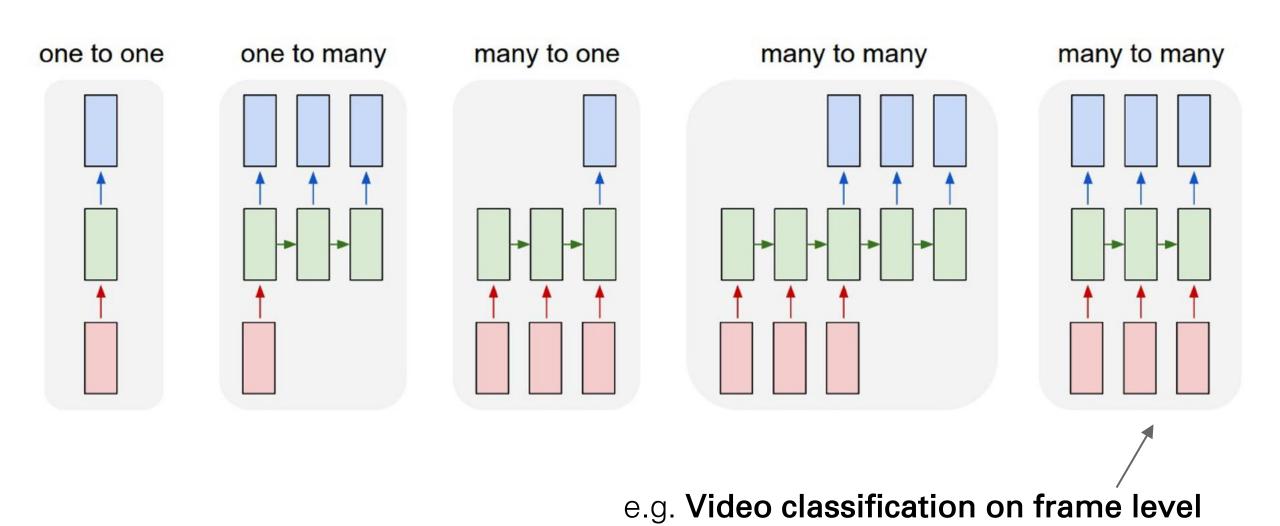

e.g. **Image Captioning** image -> sequence of words

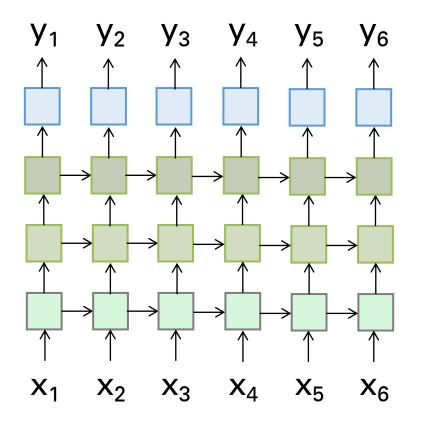

### Multi-layer RNNs

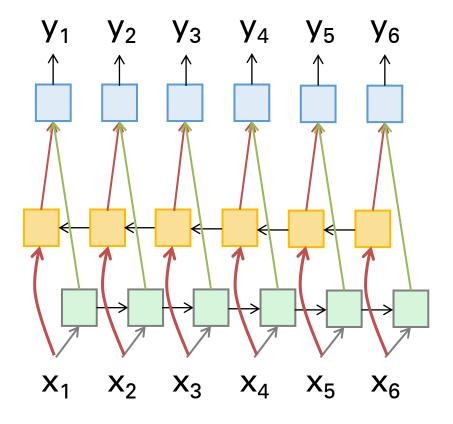

We can of course design RNNs with multiple hidden layers

• Think exotic: Skip connections across layers, across time, ...

#### **Bi-directional RNNs**

 RNNs can process the input sequence in forward and in the reverse direction

Popular in speech recognition and machine translation

# How to Train Recurrent Neural Networks

### BackPropagation Refresher

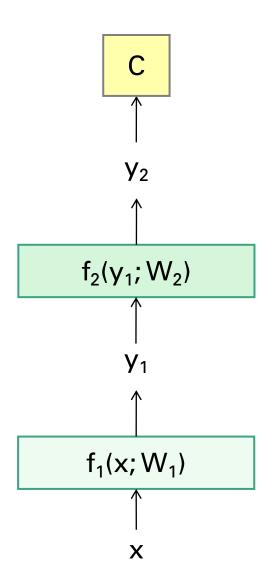

$$y = f(x; W)$$

$$C = \text{Loss}(y, y_{GT})$$

$$W \leftarrow W - \eta \frac{\partial C}{\partial W}$$

$$\frac{\partial C}{\partial W} = \left(\frac{\partial C}{\partial y}\right) \left(\frac{\partial y}{\partial W}\right)$$

### Multiple Layers

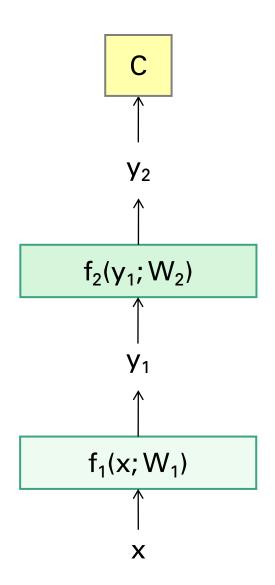

$$y_1 = f_1(x; W_1)$$
  
 $y_2 = f_2(y_1; W_2)$   
 $C = \text{Loss}(y_2, y_{GT})$ 

#### SGD Update

$$W_2 \leftarrow W_2 - \eta \frac{\partial C}{\partial W_2}$$

$$W_1 \leftarrow W_1 - \eta \frac{\partial C}{\partial W_1}$$

### Chain Rule for Gradient Computation

$$y_1 = f_1(x; W_1)$$
  
 $y_2 = f_2(y_1; W_2)$   
 $C = \text{Loss}(y_2, y_{GT})$ 

Find 
$$\frac{\partial C}{\partial W_1}$$
,  $\frac{\partial C}{\partial W_2}$ 

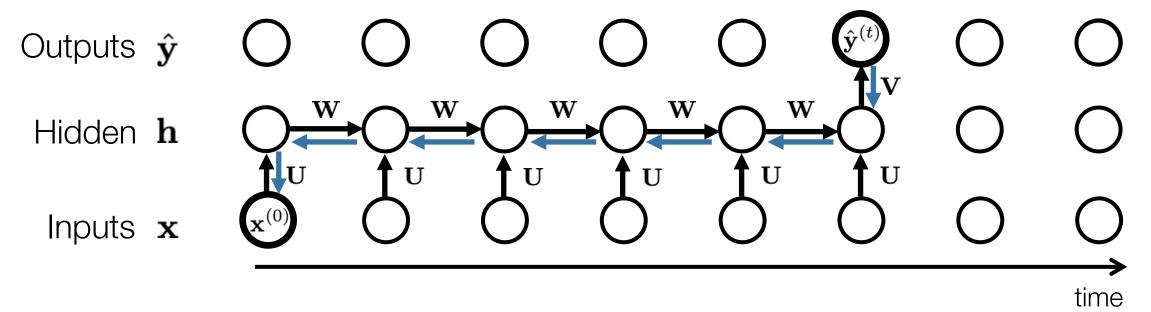

$$\frac{\partial C}{\partial W_2} = \left(\frac{\partial C}{\partial y_2}\right) \left(\frac{\partial y_2}{\partial W_2}\right)$$

$$\frac{\partial C}{\partial W_1} = \left(\frac{\partial C}{\partial y_1}\right) \left(\frac{\partial y_1}{\partial W_1}\right)$$

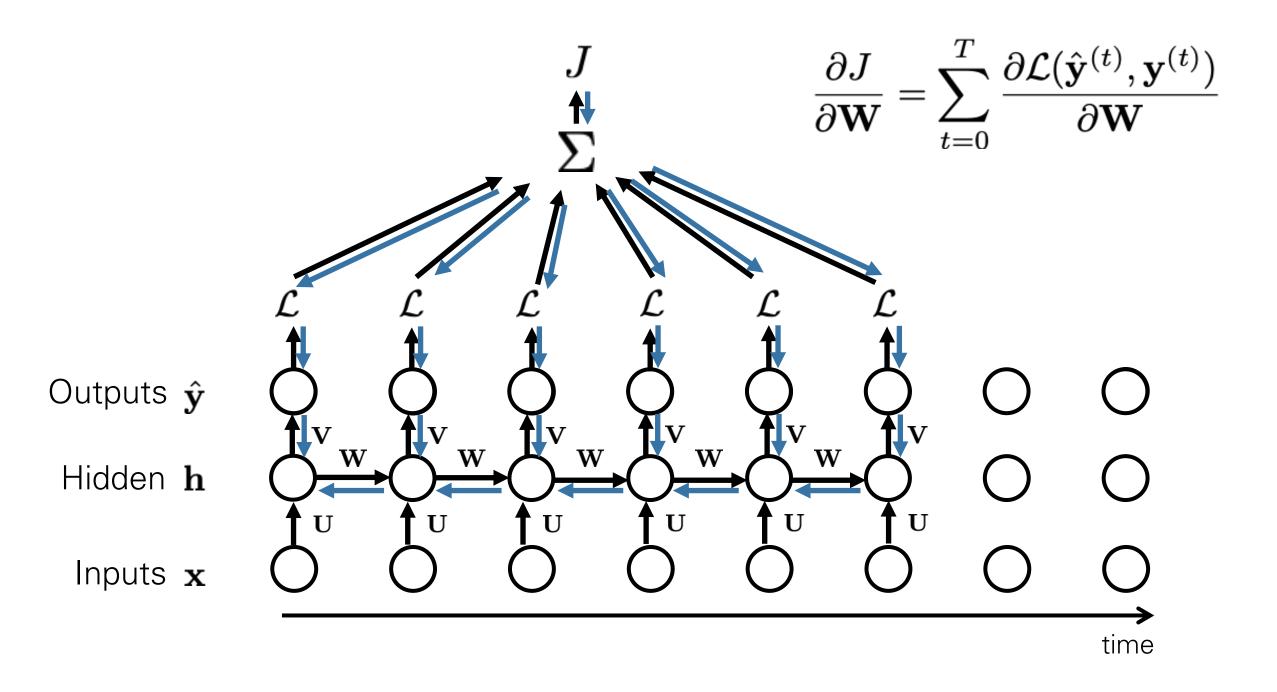

$$= \left(\frac{\partial C}{\partial y_2}\right) \left(\frac{\partial y_2}{\partial y_1}\right) \left(\frac{\partial y_1}{\partial W_1}\right)$$

Application of the Chain Rule

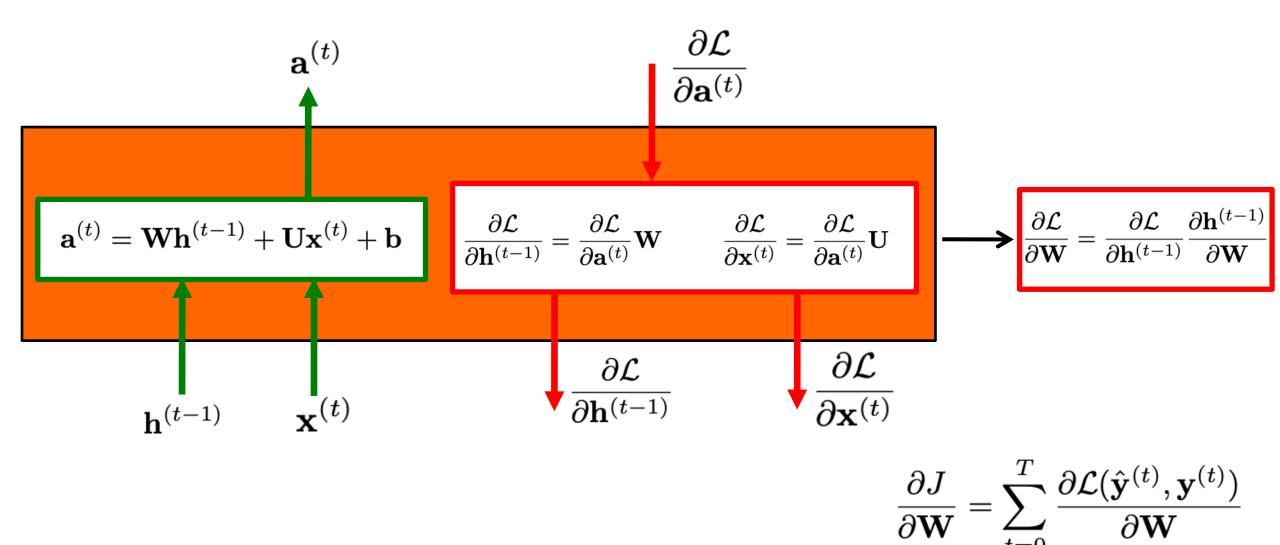

### Backprop through time

$$\frac{\partial \hat{\mathbf{y}}^{(t)}}{\partial \mathbf{x}^{(0)}} = \frac{\partial \hat{\mathbf{y}}^{(t)}}{\partial \mathbf{h}^{(t)}} \frac{\partial \mathbf{h}^{(t)}}{\partial \mathbf{h}^{(t-1)}} \cdots \frac{\partial \mathbf{h}^{(1)}}{\partial \mathbf{h}^{(0)}} \frac{\partial \mathbf{h}^{(0)}}{\partial \mathbf{x}^{(0)}}$$

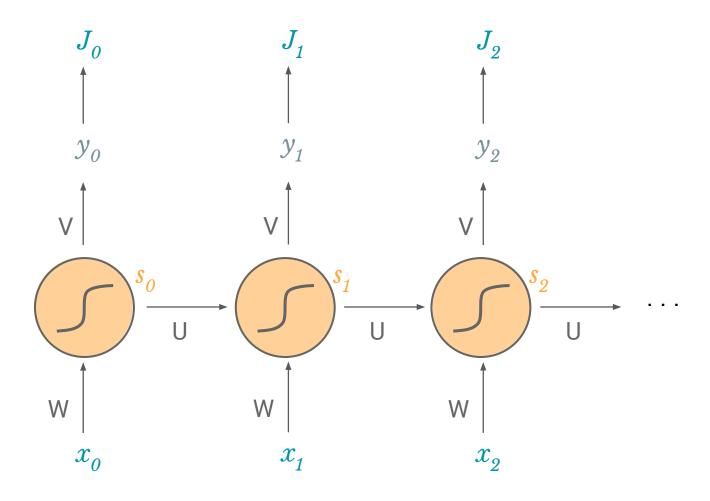

### Recurrent linear layer

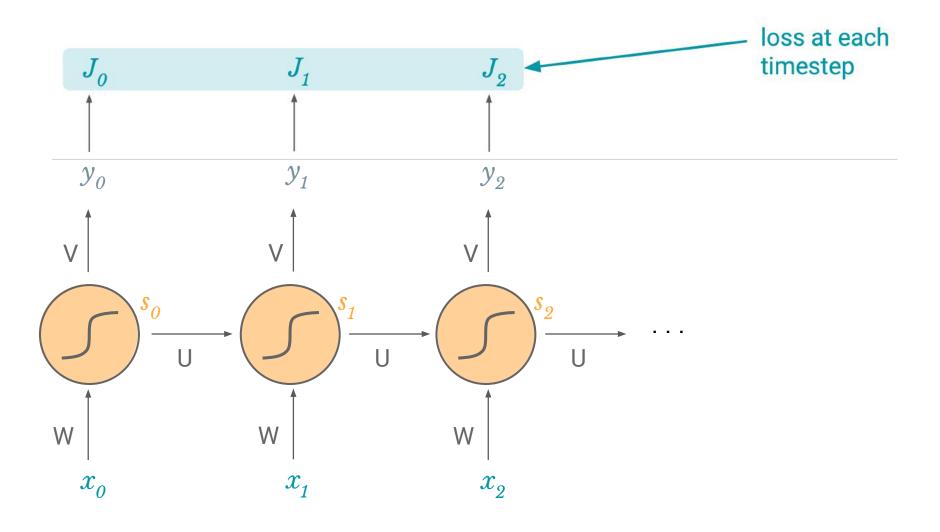

### We have a loss at each timestep:

(since we're making a prediction at each timestep)

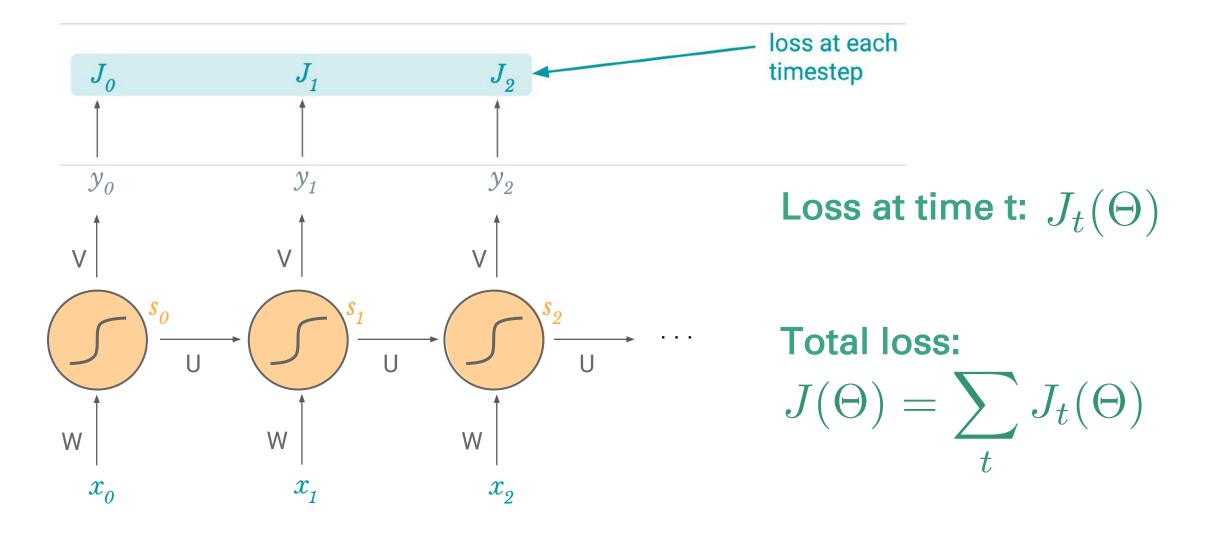

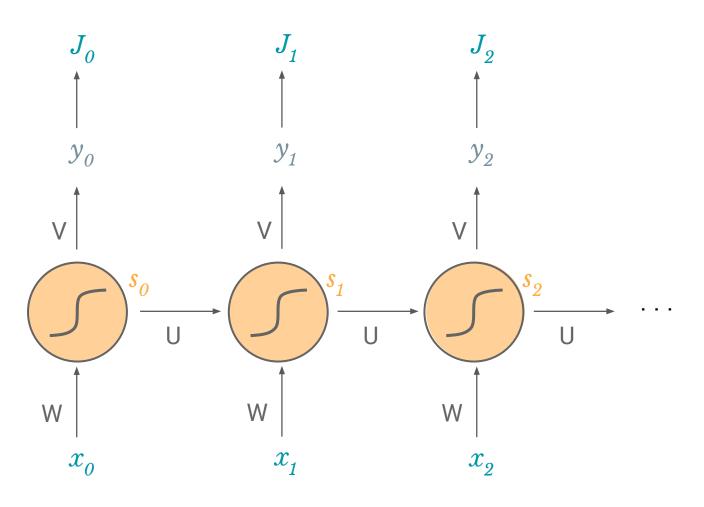

### We have a loss at each timestep:

(since we're making a prediction at each timestep)

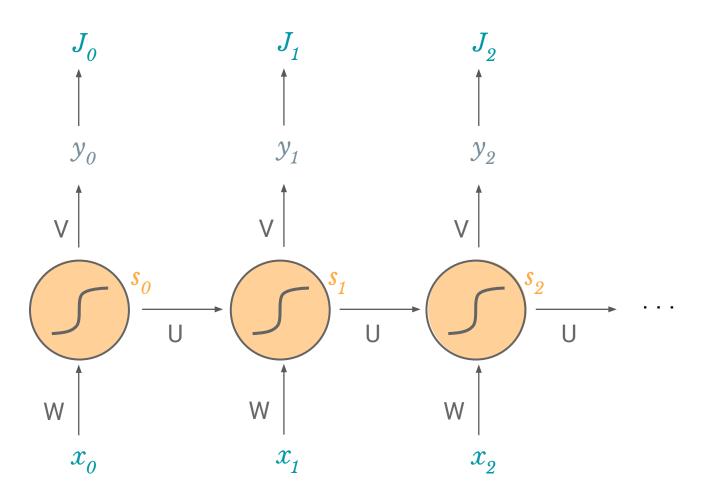

### We sum the losses across time:

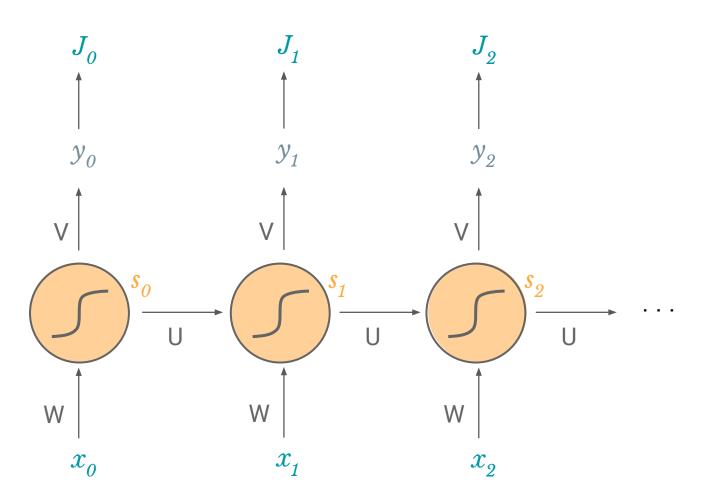

$$\frac{\partial J}{\partial W} = \sum_{t} \frac{\partial J_{t}}{\partial W}$$

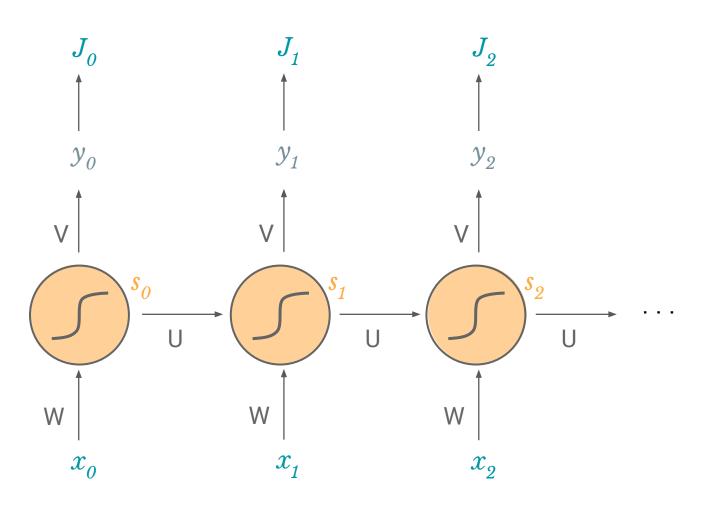

$$\frac{\partial J}{\partial W} = \sum_{t} \frac{\partial J_{t}}{\partial W}$$

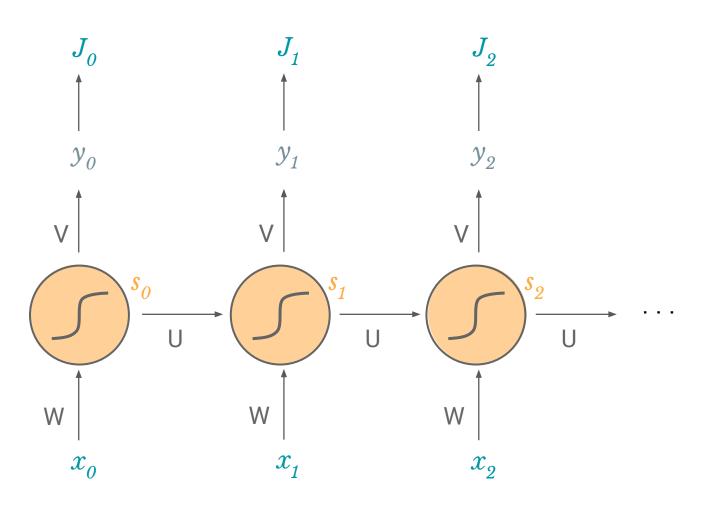

$$\frac{\partial J}{\partial W} = \sum_{t} \frac{\partial J_{t}}{\partial W}$$

$$\frac{\partial J_2}{\partial W}$$

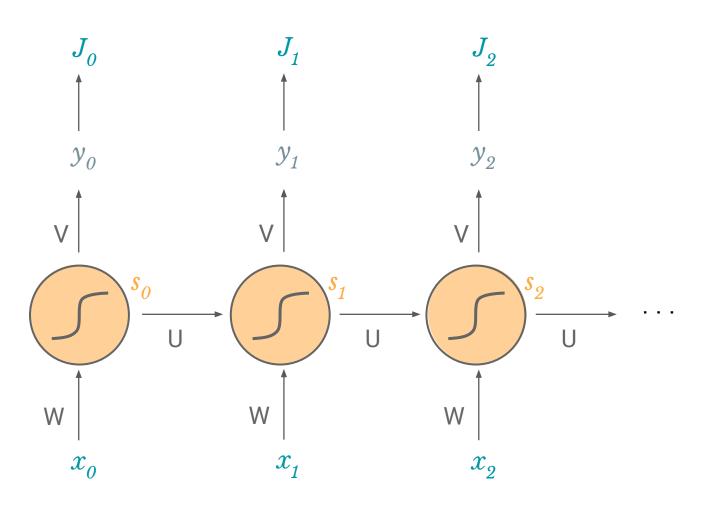

$$\frac{\partial J}{\partial W} = \sum_{t} \frac{\partial J_{t}}{\partial W}$$

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial u^2}$$

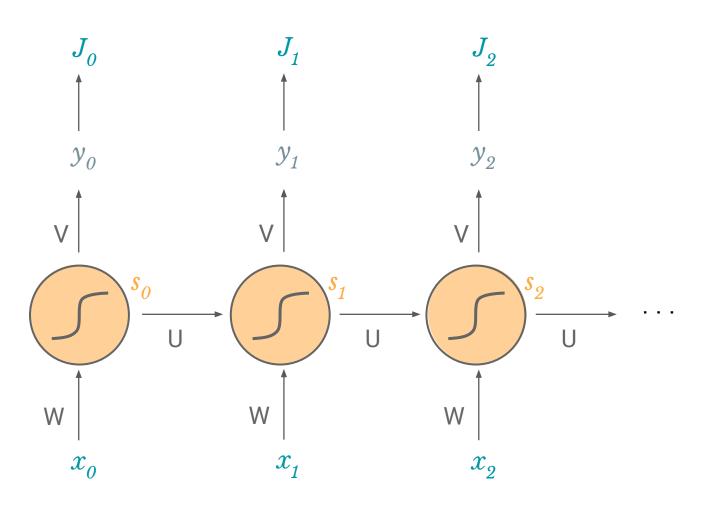

$$\frac{\partial J}{\partial W} = \sum_{t} \frac{\partial J_{t}}{\partial W}$$

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2}$$

$$\frac{\partial J}{\partial W} = \sum_{t} \frac{\partial J_{t}}{\partial W}$$

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \frac{\partial s_2}{\partial W}$$

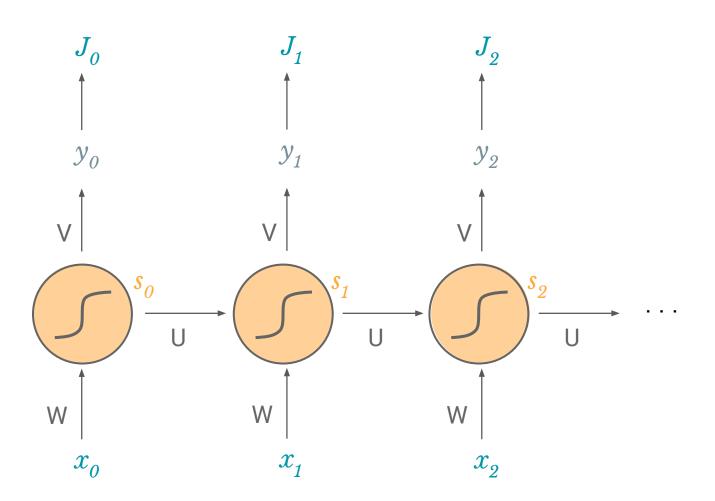

$$\frac{\partial J}{\partial W} = \sum_{t} \frac{\partial J_{t}}{\partial W}$$

so let's take a single timestep t:

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \frac{\partial s_2}{\partial W}$$

but wait...

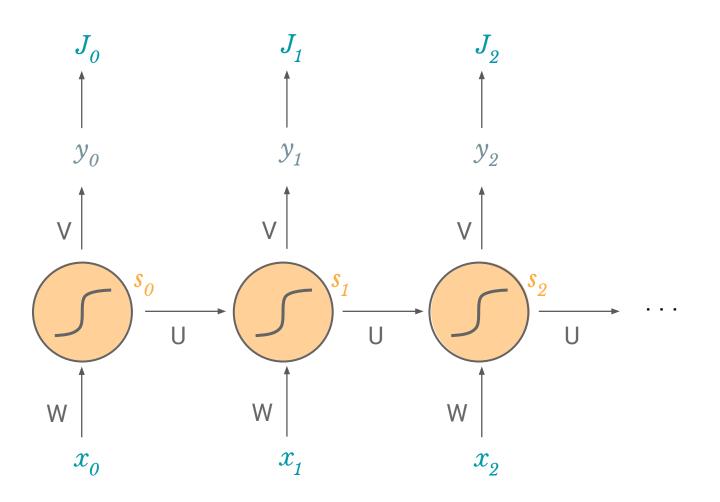

$$\frac{\partial J}{\partial W} = \sum_{t} \frac{\partial J_{t}}{\partial W}$$

so let's take a single timestep t:

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial y^2} \frac{\partial y_2}{\partial s_2} \frac{\partial s_2}{\partial W}$$

but wait...

$$s_2 = tanh(Us_1 + Wx_2)$$

$$\frac{\partial J}{\partial W} = \sum_{t} \frac{\partial J_{t}}{\partial W}$$

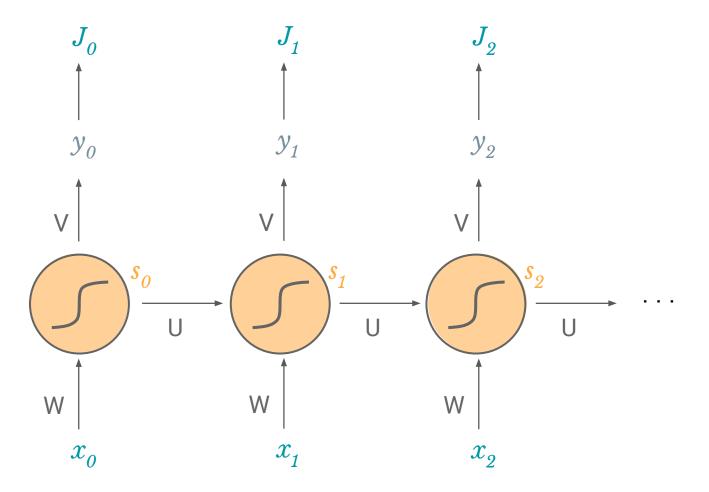

so let's take a single timestep t:

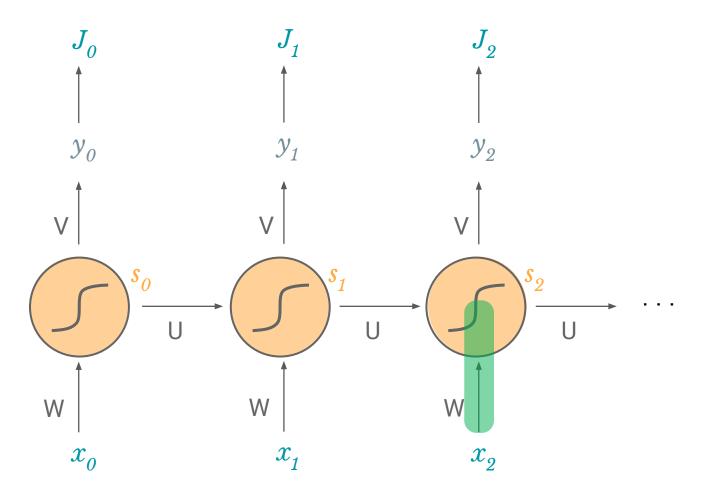

$$\frac{\partial J_2}{\partial W} = \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \frac{\partial s_2}{\partial W}$$

but wait...

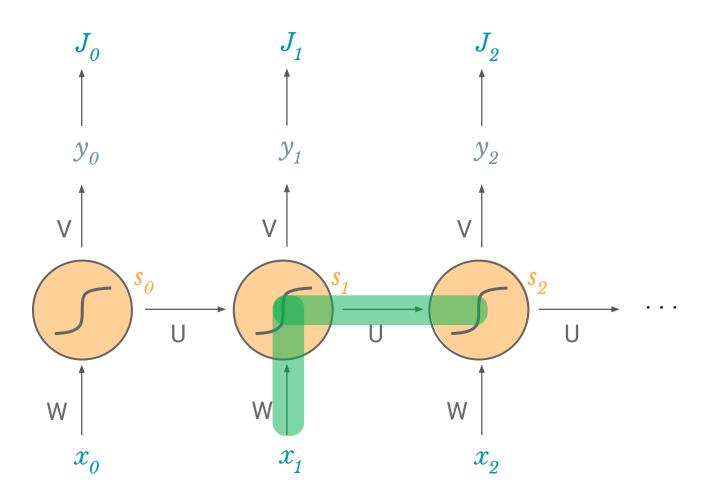

$$s_2 = tanh(Us_1 + Wx_2)$$

 $s_{\rm I}$  also depends on W so we can't just treat  $\frac{\partial s_2}{\partial W}$  as a constant!

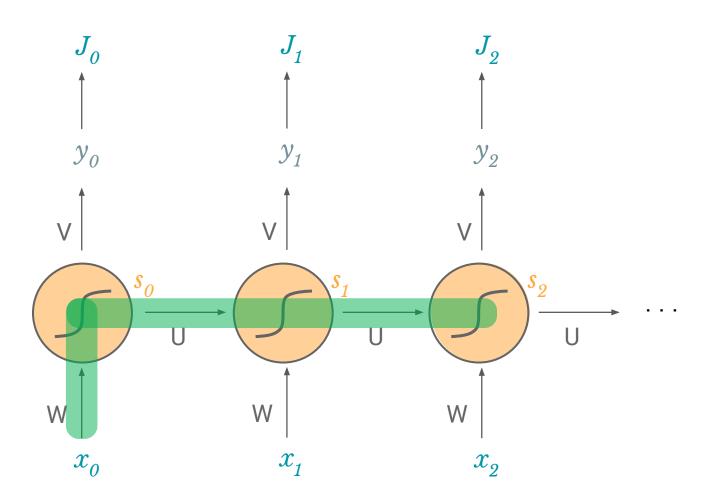

$$\frac{\partial s_2}{\partial W} + \frac{\partial s_2}{\partial s_1} \frac{\partial s_1}{\partial W}$$

$$\frac{\partial s_2}{\partial W} + \frac{\partial s_2}{\partial s_1} \frac{\partial s_1}{\partial W} + \frac{\partial s_2}{\partial s_0} \frac{\partial s_0}{\partial W}$$

### Backpropagation through time:

$$\frac{\partial J_2}{\partial W} = \sum_{k=0}^{2} \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \frac{\partial s_2}{\partial s_k} \frac{\partial s_k}{\partial W}$$

Contributions of W in previous timesteps to the error at timestep t

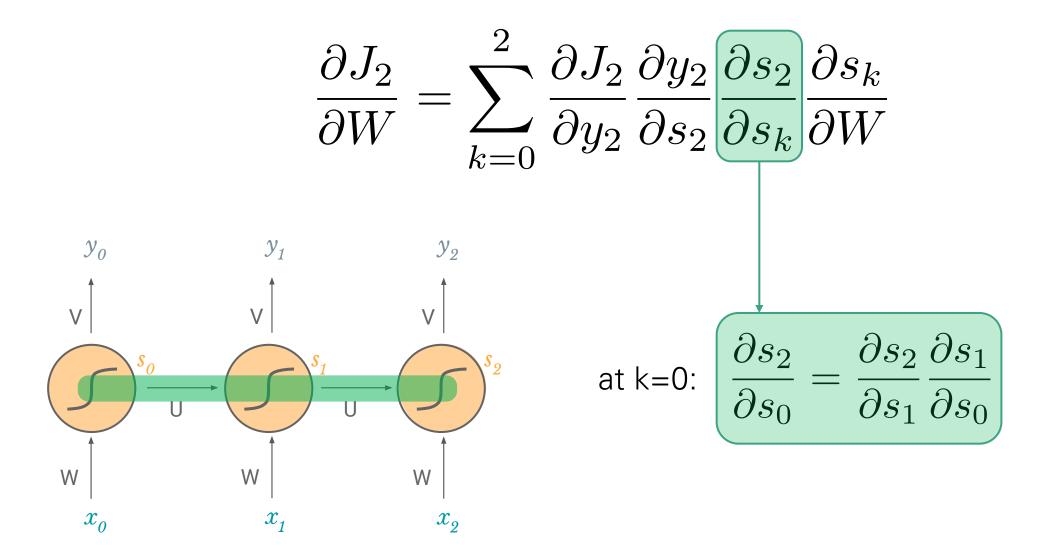

### Backpropagation through time:

$$\frac{\partial J_t}{\partial W} = \sum_{k=0}^t \frac{\partial J_t}{\partial y_t} \frac{\partial y_t}{\partial s_t} \frac{\partial s_t}{\partial s_k} \frac{\partial s_k}{\partial W}$$

Contributions of W in previous timesteps to the error at timestep t

# Why are RNNs hard to train?

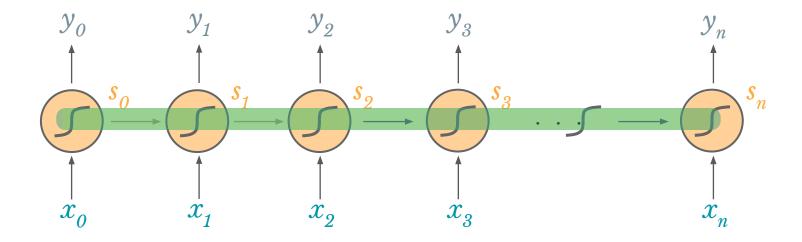

$$\frac{\partial J_2}{\partial W} = \sum_{k=0}^{2} \frac{\partial J_2}{\partial y_2} \frac{\partial y_2}{\partial s_2} \frac{\partial s_2}{\partial s_k} \frac{\partial s_k}{\partial W}$$

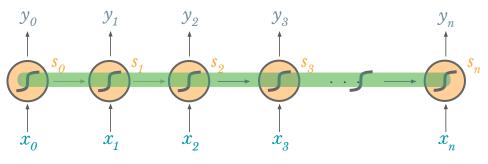

$$\frac{\partial J_n}{\partial W} = \sum_{k=0}^{n} \frac{\partial J_n}{\partial y_n} \frac{\partial y_n}{\partial s_n} \frac{\partial s_n}{\partial s_k} \frac{\partial s_k}{\partial W}$$

$$\frac{\partial s_n}{\partial s_{n-1}} \frac{\partial s_{n-1}}{\partial s_{n-2}} \cdots \frac{\partial s_3}{\partial s_2} \frac{\partial s_2}{\partial s_1} \frac{\partial s_1}{\partial s_0}$$

as the gap between timesteps gets bigger, this product gets longer and longer!

what are each of these terms?

what are each of these terms? 
$$\frac{\partial s_n}{\partial s_{n-1}} \frac{\partial s_{n-1}}{\partial s_{n-2}} \dots \frac{\partial s_3}{\partial s_2} \frac{\partial s_2}{\partial s_1} \frac{\partial s_1}{\partial s_0}$$

$$\frac{\partial s_n}{\partial s_{n-1}} = W^T diag \left[ f'(W_{s_{i-1}} + U_{x_i}) \right]$$

W =sampled from standard normal distribution = mostly < 1

f = tanh or sigmoid so f' < 1

we're multiplying a lot of small numbers together.

we're multiplying a lot of small numbers together.

#### so what?

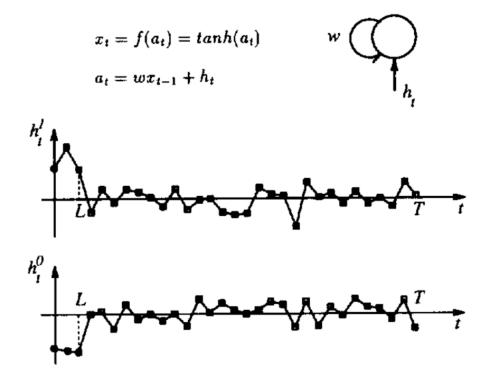

errors due to further back timesteps have increasingly smaller gradients.

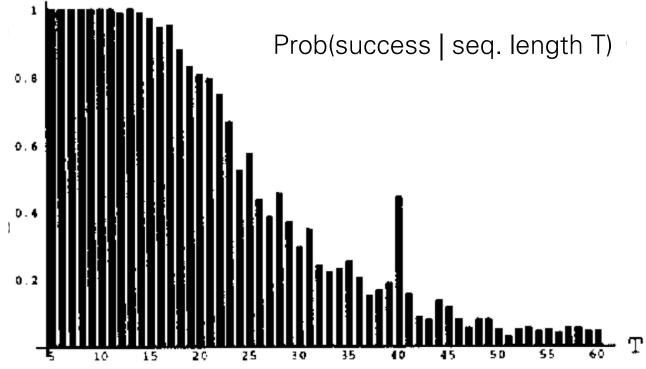

#### so what?

parameters become biased to capture shorter-term dependencies.

# A Toy Example

- 2 categories of sequences
- Can the single tanh unit learn to store for T time steps 1 bit of information given by the sign of initial input?

"In France, I had a great time and I learnt some of the \_\_\_\_ language."

our parameters are not trained to capture long-term dependencies, so the word we predict will mostly depend on the previous few words, not much earlier ones

# Long-Term Dependencies

• The RNN gradient is a product of Jacobian matrices, each associated with a step in the forward computation. To store information robustly in a finite-dimensional state, the dynamics must be contractive [Bengio et al 1994].

$$L = L(s_T(s_{T-1}(\dots s_{t+1}(s_t, \dots))))$$

$$\frac{\partial L}{\partial s_t} = \frac{\partial L}{\partial s_T} \frac{\partial s_T}{\partial s_{T-1}} \dots \frac{\partial s_{t+1}}{\partial s_t}$$

- Problems:
  - sing. values of Jacobians > 1 → gradients explode
  - or sing. values < → gradients shrink & vanish</li>
  - or random → variance grows exponentially

#### **RNN Tricks**

(Pascanu et al., 2013; Bengio et al., 2013; Gal and Ghahramani, 2016; Morishita et al., 2017)

- Mini-batch creation strategies (efficient computations)
- Clipping gradients (avoid exploding gradients)
- Leaky integration (propagate long-term dependencies)
- Momentum (cheap 2nd order)
- Dropout (avoid overfitting)
- Initialization (start in right ballpark avoids exploding/vanishing)
- Sparse Gradients (symmetry breaking)
- Gradient propagation regularizer (avoid vanishing gradient)
- Gated self-loops (LSTM & GRU, reduces vanishing gradient)

# Mini-batching in RNNs

- Mini-batching makes things much faster!
- But mini-batching in RNNs is harder than in feed-forward networks
  - Each word depends on the previous word
  - Sequences are of various length

Padding:

```
this is an example </s>
this is another </s>
```

- If we use sentences of different lengths, too much padding and sorting can result in decreased performance
- To remedy this: sort sentences so similarly-lengthed seqs are in the same batch

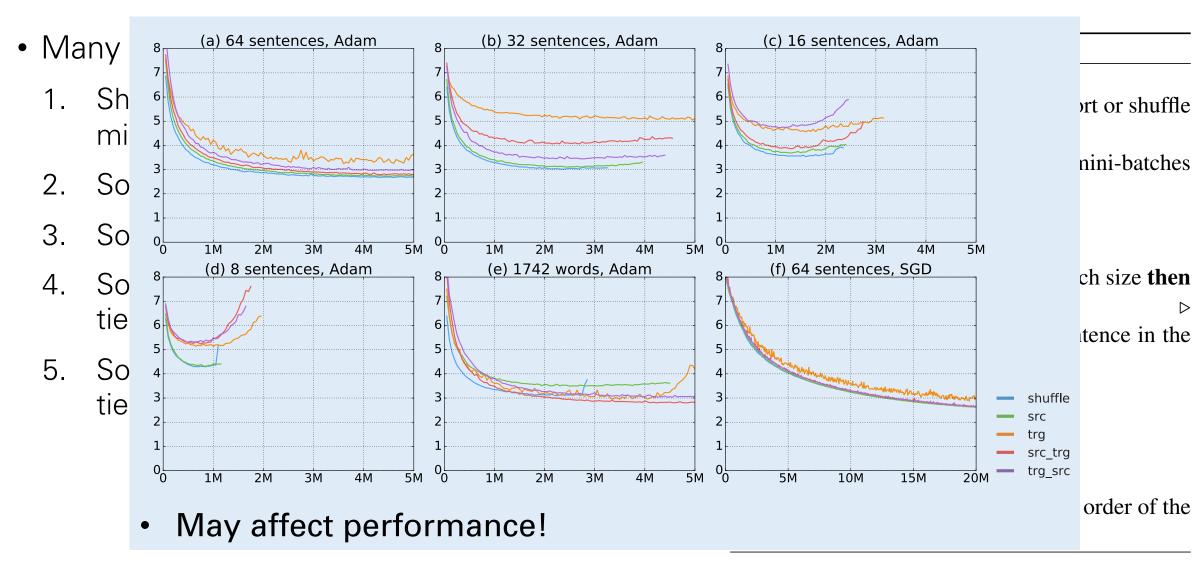

# Mini-batching in RNNs

- Many alternatives:
  - Shuffle the corpus randomly before creating mini-batches (with no sorting).
  - 2. Sort based on the source sequence length.
  - 3. Sort based on the target sequence length.
  - 4. Sort using the source sequence length, break ties by sorting by target sequence length.
  - 5. Sort using the target sequence length, break ties by sorting by source sequence length.

#### **Algorithm 1** Create mini-batches

- 1:  $C \leftarrow \text{Training corpus}$
- 2:  $C \leftarrow \operatorname{sort}(C)$  or  $\operatorname{shuffle}(C) \triangleright \operatorname{sort}$  or  $\operatorname{shuffle}$  the whole  $\operatorname{corpus}$
- 3:  $\boldsymbol{B} \leftarrow \{\}$   $\triangleright$  mini-batches
- 4:  $i \leftarrow 0, j \leftarrow 0$
- 5: while i < C.size() do
- 6:  $\boldsymbol{B}[j] \leftarrow \boldsymbol{B}[j] + \boldsymbol{C}[i]$
- 7: **if** B[j].size()  $\geq$  max mini-batch size **then**
- 8:  $B[j] \leftarrow \text{padding}(B[j])$   $\triangleright$  Padding tokens to the longest sentence in the mini-batch
- 9:  $j \leftarrow j + 1$
- 10: **end if**
- 11:  $i \leftarrow i + 1$
- 12: end while
- 13:  $B \leftarrow \text{shuffle}(B) \Rightarrow \text{shuffle the order of the mini-batches}$

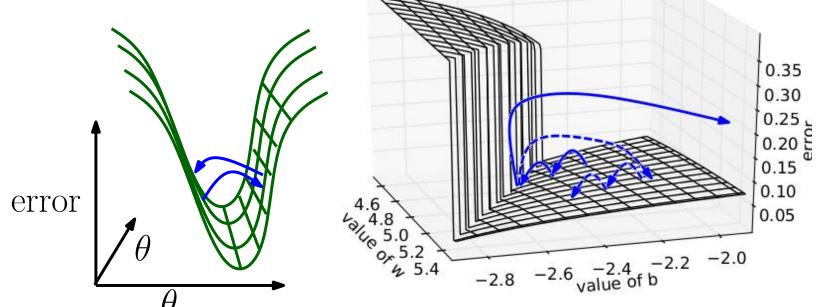

# Mini-batching in RNNs

M. Morishita, Y. Oda, G. Neubig, K. Yoshino, K. Sudoh, and S. Nakamura. "An Empirical Study of Mini-Batch Creation Strategies for Neural Machine Translation". 1st Workshop on NMT 2017

# **Gradient Norm Clipping**

$$\begin{array}{l} \hat{\mathbf{g}} \leftarrow \frac{\partial error}{\partial \theta} \\ \text{if } ||\hat{\mathbf{g}}|| \geq threshold \text{ then} \\ \hat{\mathbf{g}} \leftarrow \frac{threshold}{\|\hat{\mathbf{g}}\|} \hat{\mathbf{g}} \\ \text{end if} \end{array}$$

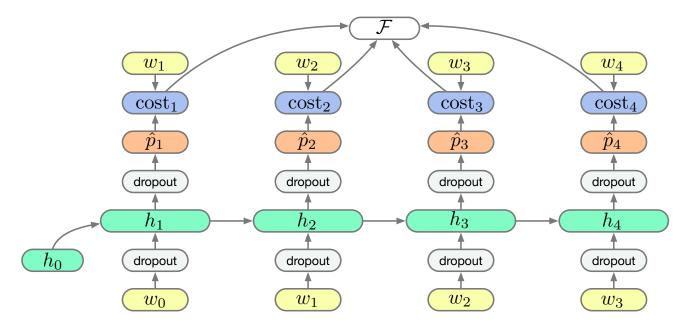

Recurrent neural network regularization. Zaremba et al., arXiv 2014.

# Regularization: Dropout

- Large recurrent networks often overfit their training data by memorizing the sequences observed. Such models generalize poorly to novel sequences.
- A common approach in Deep Learning is to overparametrize a model, such that it could easily memorize the training data, and then heavily regularize it to facilitate generalization.
- The regularization method of choice is often Dropout.

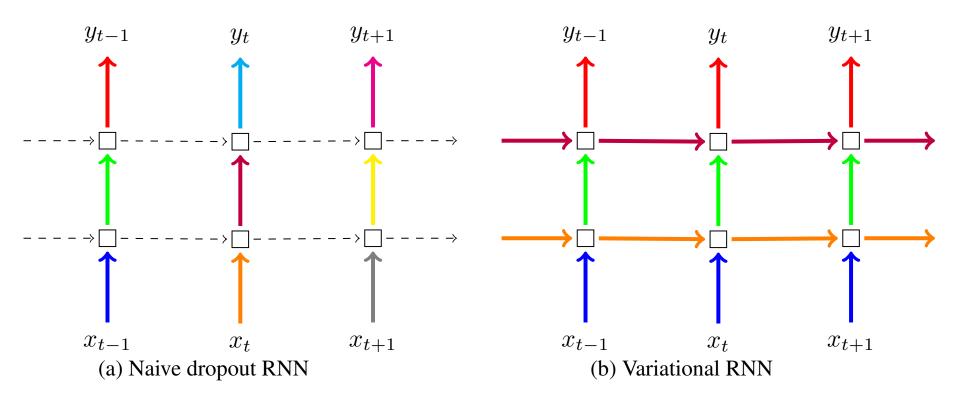

# Regularization: Dropout

- Dropout is ineffective when applied to recurrent connections, as repeated random masks zero all hidden units in the limit.
- The most common solution is to only apply dropout to non-recurrent connections

# Regularization: Dropout

• A Better Solution: Use the same dropout mask at each time step for both inputs, outputs, and recurrent layers.

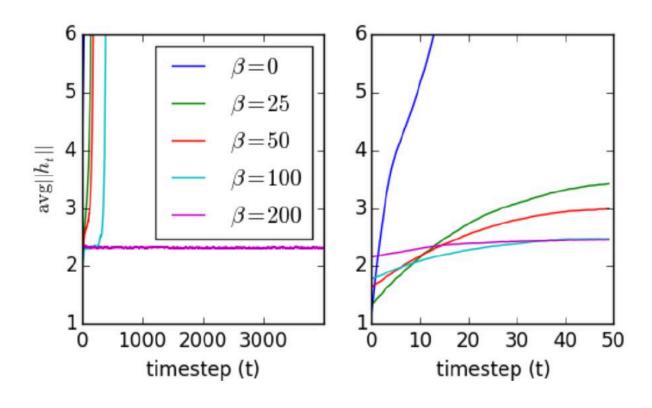

Each square represents an RNN unit, with horizontal arrows representing recurrent connections. Vertical arrows represent the input and output to each RNN unit. Coloured connections represent dropped-out inputs, with different colours corresponding to different dropout masks. Dashed lines correspond to standard connections with no dropout.

#### Regularization: Norm-stabilizer

 Stabilize the activations of RNNs by penalizing the squared distance between successive hidden states' norms

$$\beta \frac{1}{T} \sum_{t=1}^{T} (\|h_t\|_2 - \|h_{t-1}\|_2)^2$$

 Enforce the norms of the hidden layer activations approximately constant across time

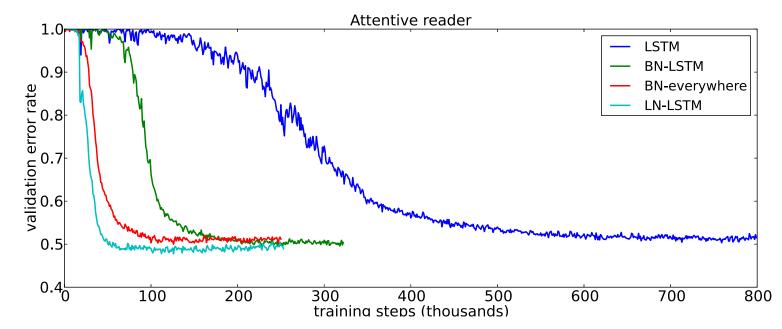

# Regularization: Layer Normalization

- Similar to batch normalization
- Computes the normalization statistics separately at each time step
- Effective for stabilizing the hidden state dynamics in RNNs
- Reduces training time

$$\mathbf{h}^{t} = f \left[ \frac{\mathbf{g}}{\sigma^{t}} \odot (\mathbf{a}^{t} - \mu^{t}) + \mathbf{b} \right]$$

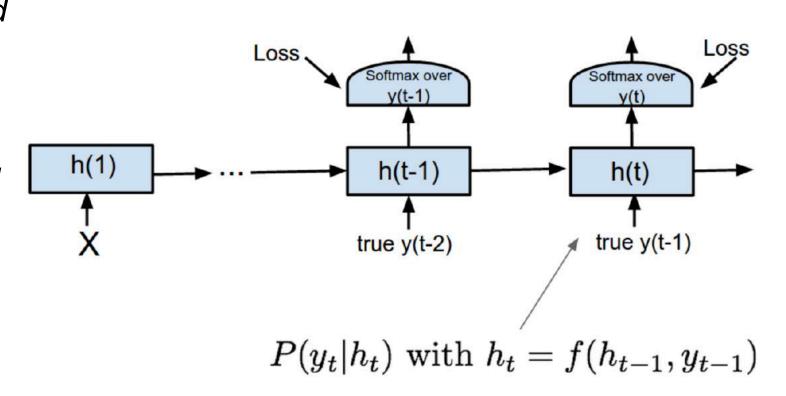

$$\mu^{t} = \frac{1}{H} \sum_{i=1}^{H} a_{i}^{t}$$

$$\sigma^{t} = \sqrt{\frac{1}{H} \sum_{i=1}^{H} (a_{i}^{t} - \mu^{t})^{2}}$$

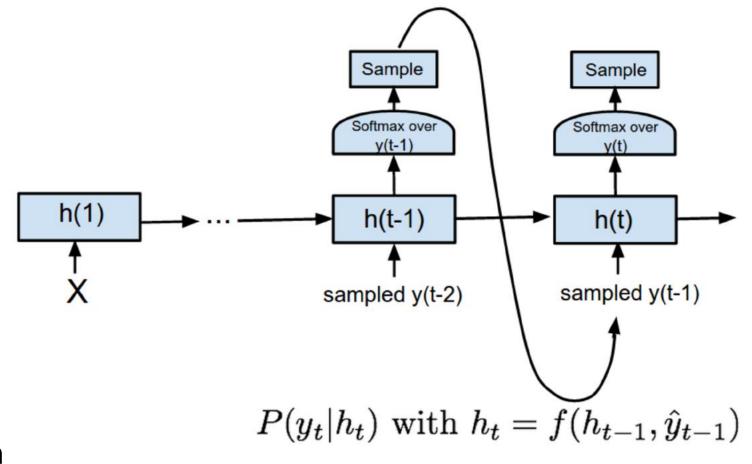

# Scheduled Sampling

 "change the training process from a fully guided scheme using the true previous token, towards a less guided scheme which mostly uses the generated token instead."

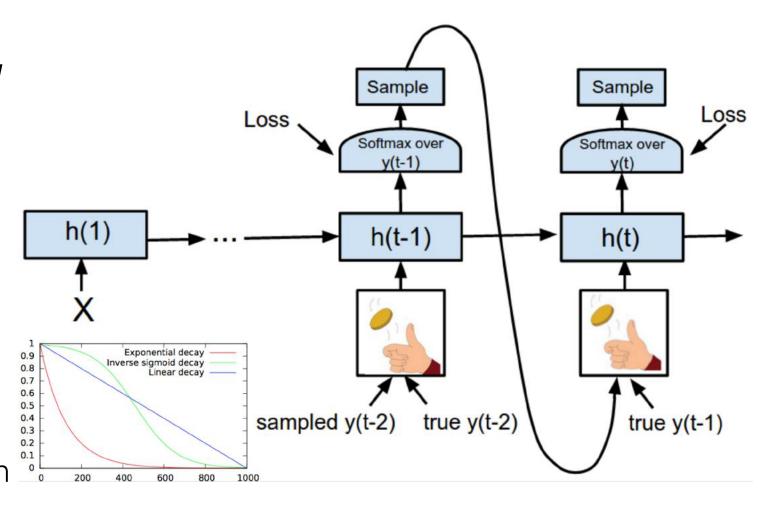

# Scheduled Sampling

- "change the training process from a fully guided scheme using the true previous token, towards a less guided scheme which mostly uses the generated token instead."
- During training, randomly replace a conditioning ground truth token by the model's previous prediction

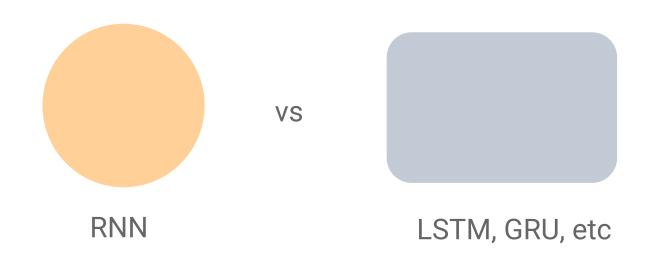

# Scheduled Sampling

- "change the training process from a fully guided scheme using the true previous token, towards a less guided scheme which mostly uses the generated token instead."
- During training, randomly replace a conditioning ground truth token by the model's previous prediction

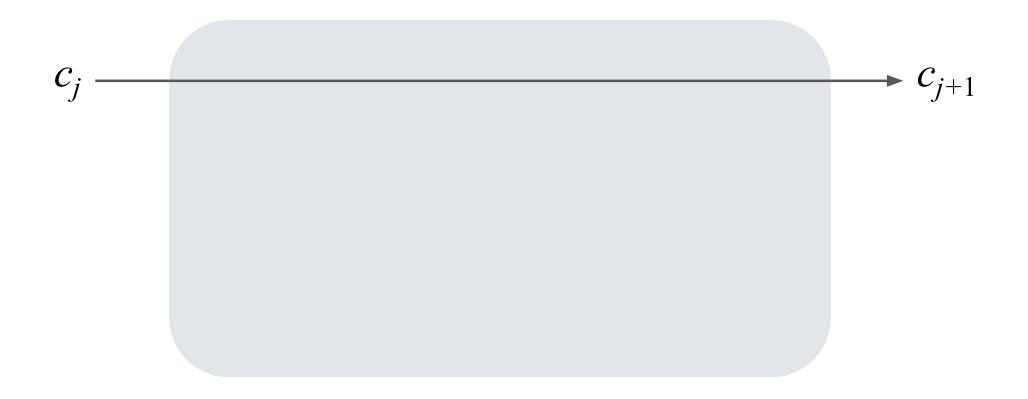

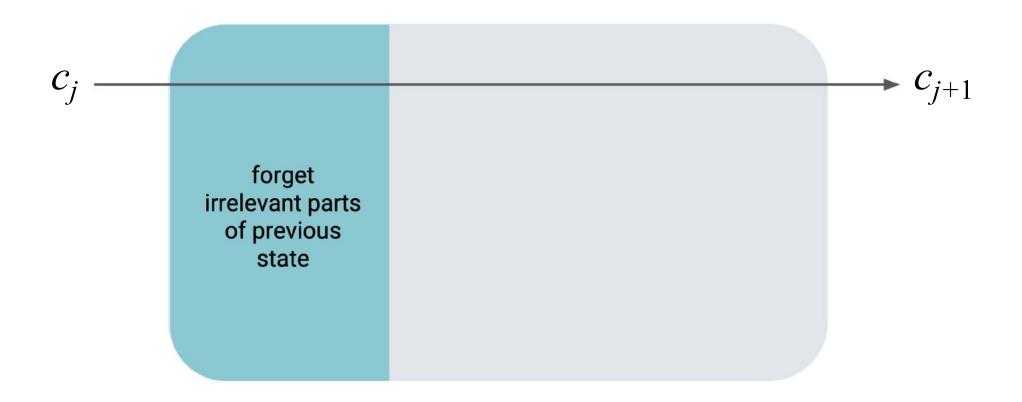

#### **Gated Cells**

 rather each node being just a simple RNN cell, make each node a more complex unit with gates controlling what information is passed through

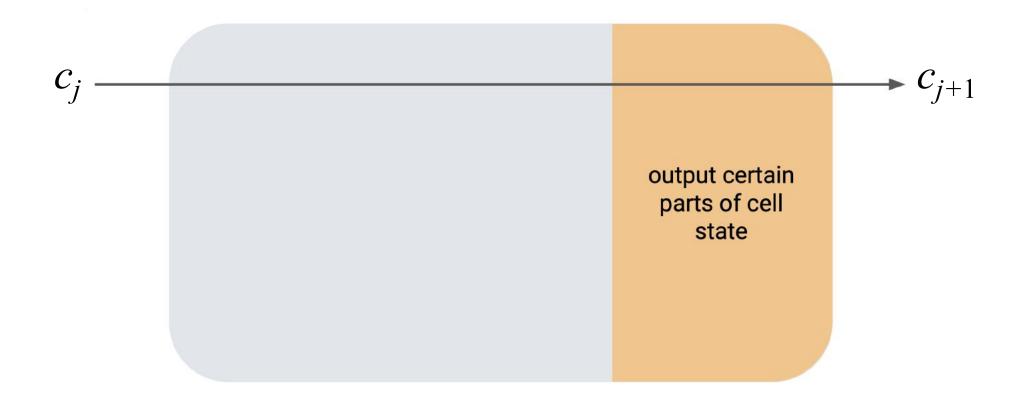

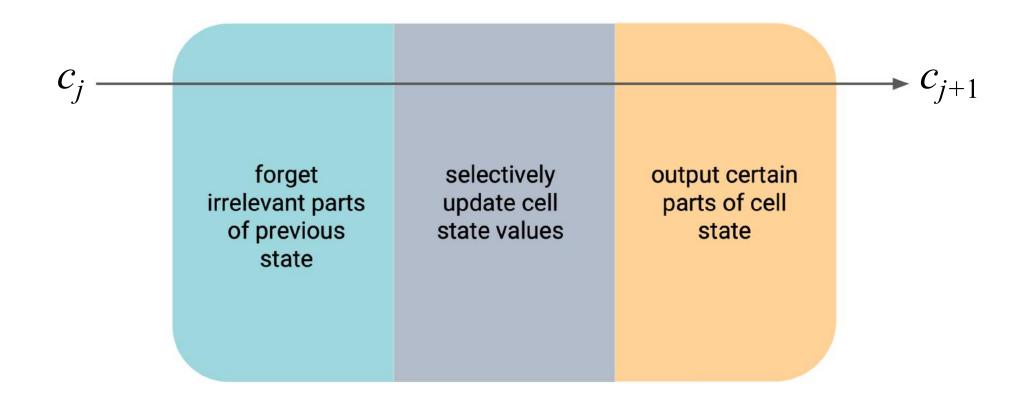

Long short term memory cells are able to keep track of information throughout many timesteps.

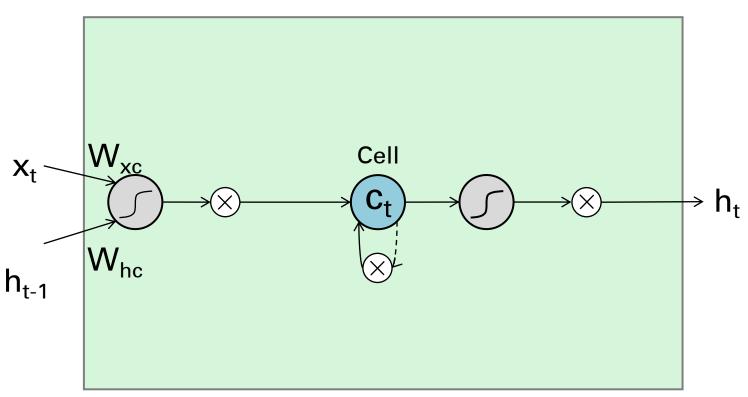

#### The LSTM Idea

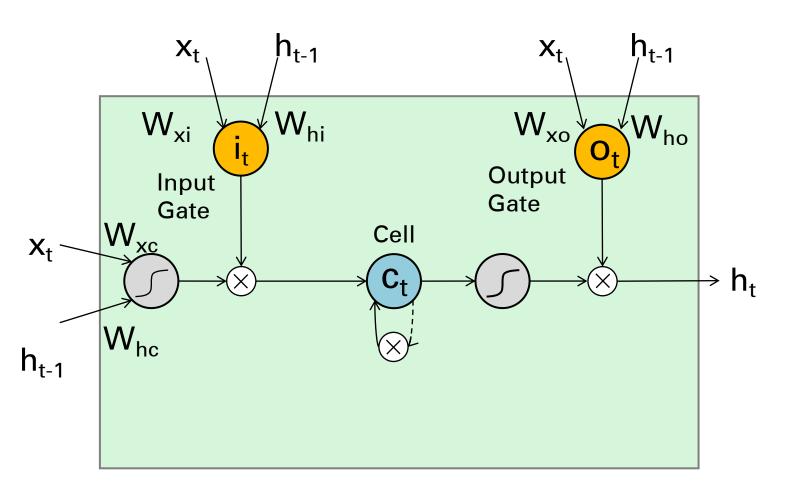

$$c_{t} = c_{t-1} + \tanh W \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix}$$

$$h_{t} = \tanh c_{t}$$

<sup>\*</sup> Dashed line indicates time-lag

## The Original LSTM Cell

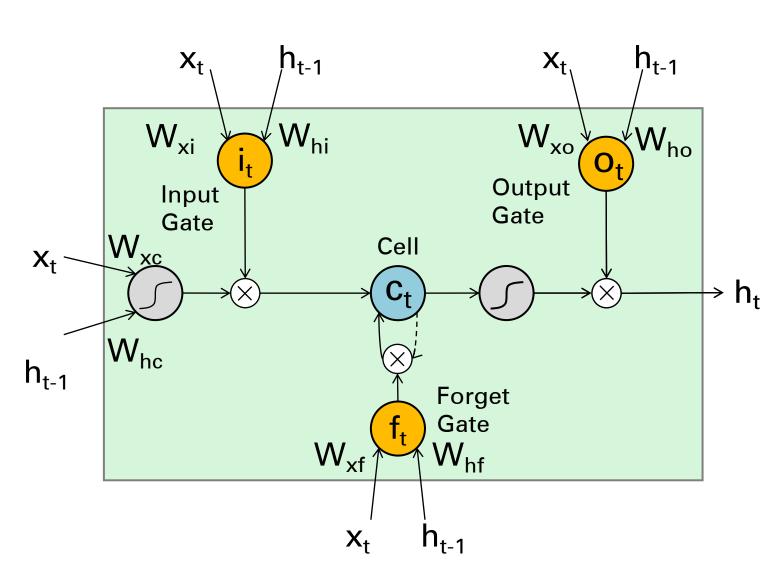

$$c_{t} = c_{t-1} + i_{t} \otimes \tanh W \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix}$$

$$h_t = o_t \otimes \tanh c_t$$

$$i_{t} = \sigma \left( W_{i} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{i} \right)$$

Similarly for ot

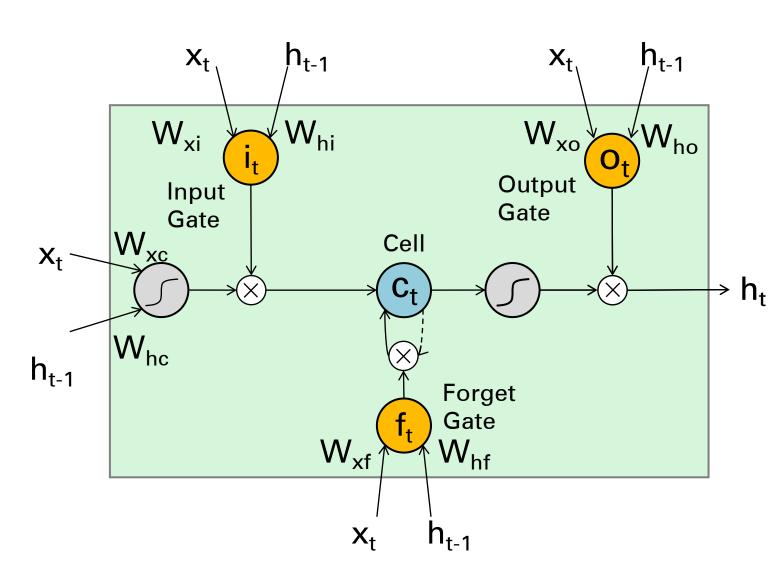

$$i_{t} = \sigma \left( W_{i} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{i} \right)$$

$$c_{t} = f_{t} \otimes c_{t-1} + i_{t} \otimes \tanh W \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix}$$

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = o_t \otimes \tanh c_t$$

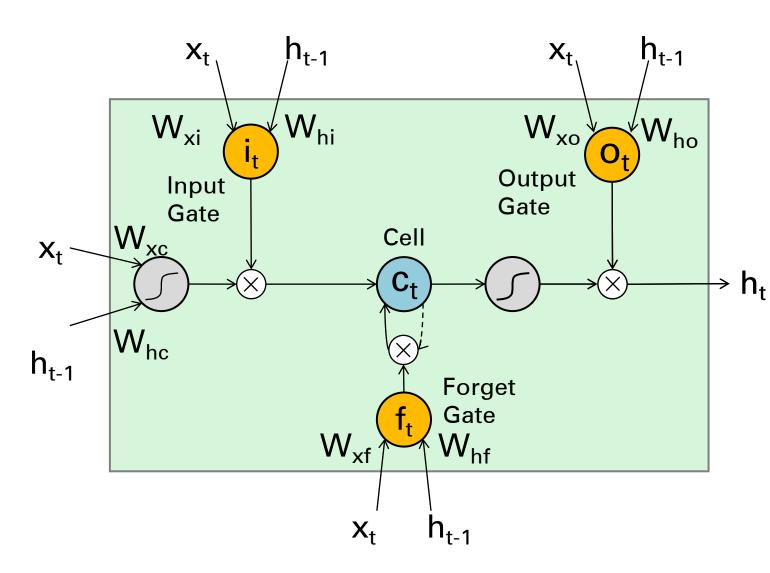

$$i_{t} = \sigma \left( W_{i} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{i} \right)$$

$$c_{t} = f_{t} \otimes c_{t-1} + i_{t} \otimes \tanh W \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix}$$

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = o_t \otimes \tanh c_t$$

**forget gate** decides what information is going to be thrown away from the cell state

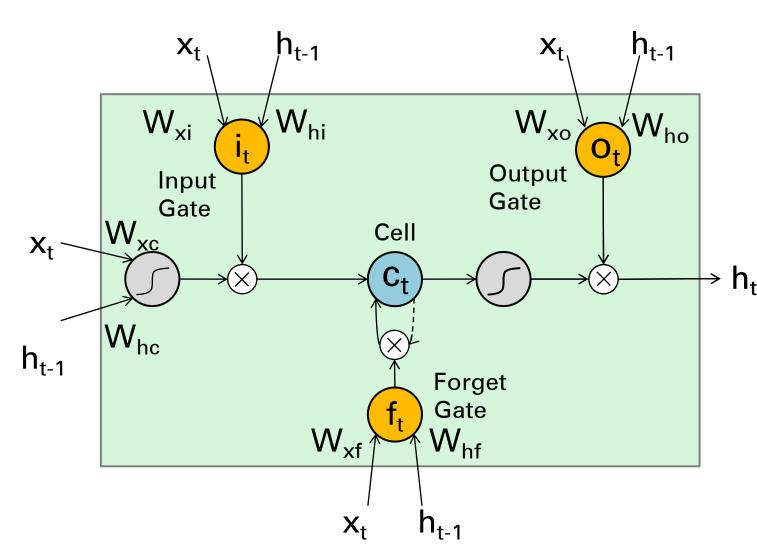

$$i_{t} = \sigma \left( W_{i} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{i} \right)$$

$$c_{t} = f_{t} \otimes c_{t-1} + i_{t} \otimes \tanh W \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix}$$

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = o_t \otimes \tanh c_t$$

input gate and a tanh layer decides what information is going to be stored in the cell state

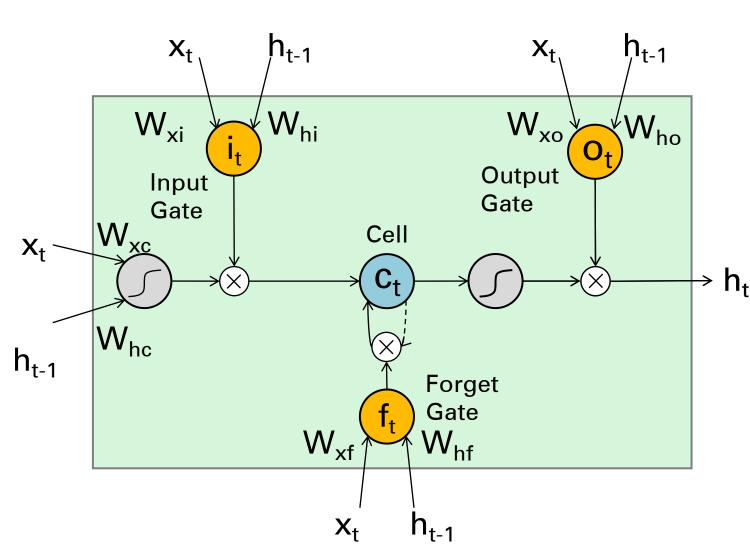

$$i_{t} = \sigma \left( W_{i} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{i} \right)$$

$$c_{t} = f_{t} \otimes c_{t-1} + i_{t} \otimes \tanh W \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix}$$

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_t = o_t \otimes \tanh c_t$$

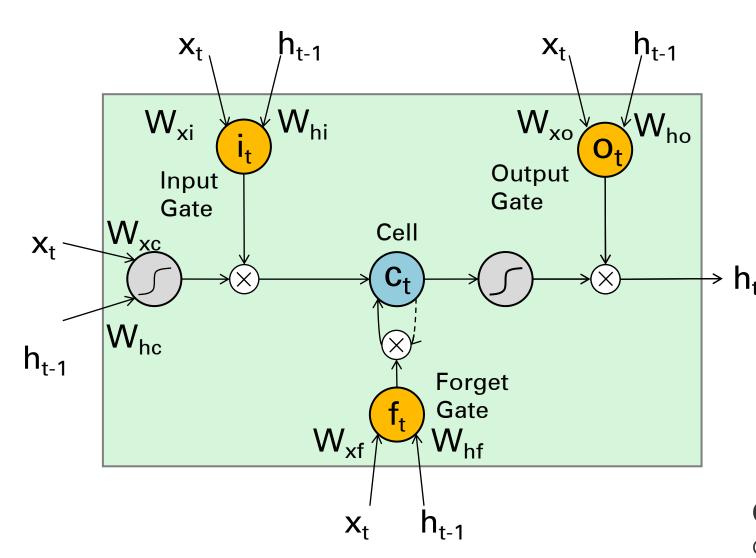

Update the old cell state with the new one.

$$i_{t} = \sigma \left( W_{i} \begin{pmatrix} X_{t} \\ h_{t-1} \end{pmatrix} + b_{i} \right)$$

$$c_{t} = f_{t} \otimes c_{t-1} + i_{t} \otimes \tanh W \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix}$$

input gate	forget gate	behavior
0	1	remember the previous value
1	1	add to the previous value
0	0	erase the value
1	0	overwrite the value

$$i_{t} = \sigma \left( W_{i} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{i} \right)$$

$$c_{t} = f_{t} \otimes c_{t-1} + i_{t} \otimes \tanh W \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix}$$

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

$$h_{t} = o_{t} \otimes \tanh c_{t}$$

$$o_{i} = \sigma \left( W_{o} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{o} \right)$$

**Output gate** decides what is going to be outputted. The final output is based on cell state and output of sigmoid gate.

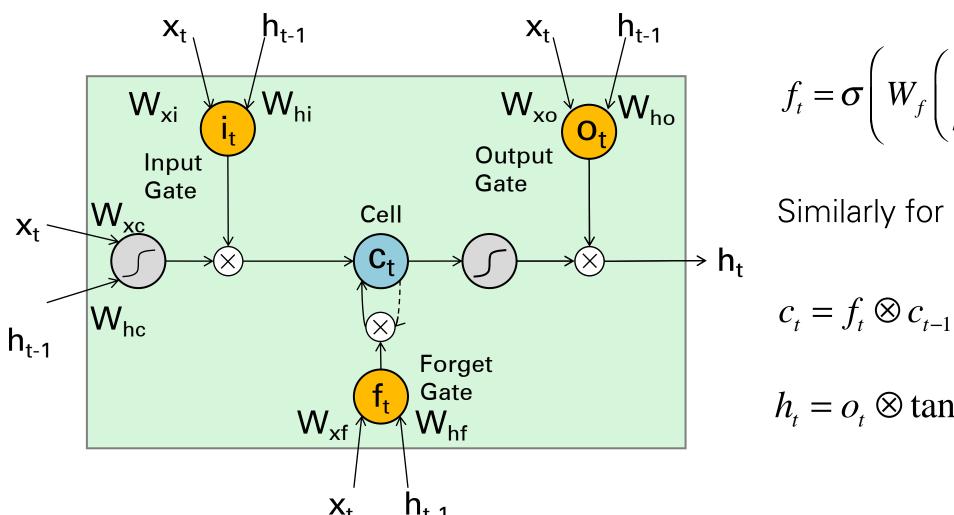

#### LSTM - Forward/Backward

Illustrated LSTM Forward and Backward Pass

http://arunmallya.github.io/writeups/nn/lstm/index.html

## LSTM variants

## The Popular LSTM Cell

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \end{pmatrix} + b_f \right)$$

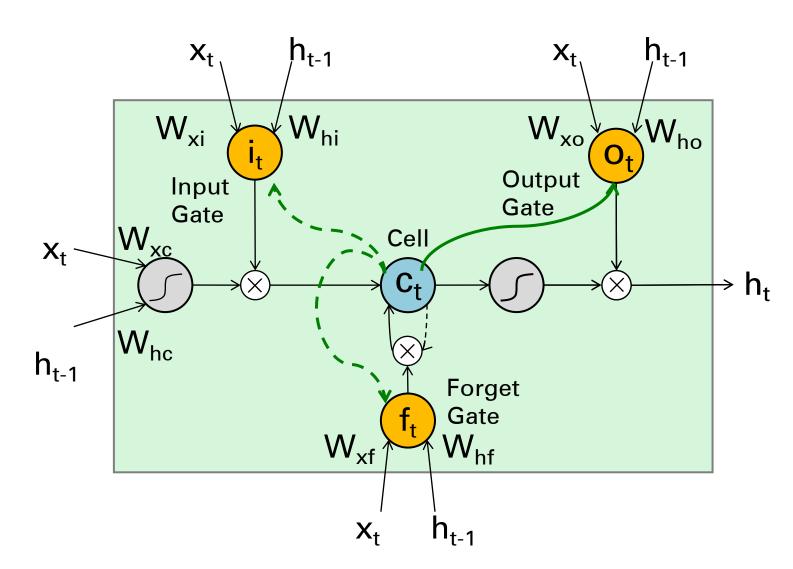

Similarly for i<sub>t</sub>, o<sub>t</sub>

$$c_{t} = f_{t} \otimes c_{t-1} + i_{t} \otimes \tanh W \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix}$$

$$h_t = o_t \otimes \tanh c_t$$

<sup>\*</sup> Dashed line indicates time-lag

## **Extension I: Peephole LSTM**

$$f_t = \sigma \left( W_f \begin{pmatrix} x_t \\ h_{t-1} \\ C_{t-1} \end{pmatrix} + b_f \right)$$

Similarly for i<sub>t</sub>, o<sub>t</sub> (uses c<sub>t</sub>)

$$c_{t} = f_{t} \otimes c_{t-1} + i_{t} \otimes \tanh W \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix}$$

$$h_t = o_t \otimes \tanh c_t$$

- Add peephole connections.
- All gate layers look at the cell state!

<sup>\*</sup> Dashed line indicates time-lag

#### Other minor variants

Coupled Input and Forget Gate

$$f_t = 1 - i_t$$

• Full Gate Recurrence

$$f_t = \sigma \begin{pmatrix} \begin{pmatrix} x_t \\ h_{t-1} \\ \vdots \\ f_{t-1} \\ f_{t-1} \\ O_{t-1} \end{pmatrix} + b_f$$

## LSTM: A Search Space Odyssey

- Tested the following variants, using Peephole LSTM as standard:
  - 1. No Input Gate (NIG)
  - 2. No Forget Gate (NFG)
  - 3. No Output Gate (NOG)
  - 4. No Input Activation Function (NIAF)
  - 5. No Output Activation Function (NOAF)
  - 6. No Peepholes (NP)
  - 7. Coupled Input and Forget Gate (CIFG)
  - 8. Full Gate Recurrence (FGR)
- On the tasks of:
  - Timit Speech Recognition: Audio frame to 1 of 61 phonemes
  - IAM Online Handwriting Recognition: Sketch to characters
  - JSB Chorales: Next-step music frame prediction

## LSTM: A Search Space Odyssey

- The standard LSTM performed reasonably well on multiple datasets and none of the modifications significantly improved the performance
- Coupling gates and removing peephole connections simplified the LSTM without hurting performance much
- The forget gate and output activation are crucial

 Found interaction between learning rate and network size to be minimal – indicates calibration can be done using a small network first

# Gated Recurrent Unit

## Gated Recurrent Unit (GRU)

- A very simplified version of the LSTM
  - Merges forget and input gate into a single 'update' gate
  - Merges cell and hidden state
- Has fewer parameters than an LSTM and has been shown to outperform LSTM on some tasks

<u>Learning Phrase Representations using RNN Encoder-Decoder for Statistical Machine Translation</u>
[Cho et al.,14]

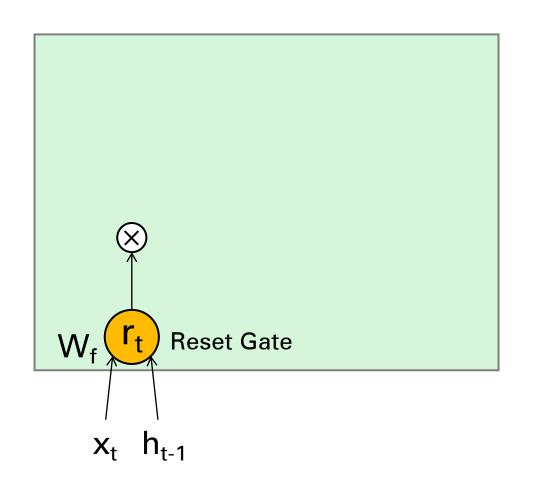

$$r_{t} = \sigma \left( W_{r} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{f} \right)$$

$$h'_{t} = \tanh W \begin{pmatrix} x_{t} \\ r_{t} \otimes h_{t-1} \end{pmatrix}$$

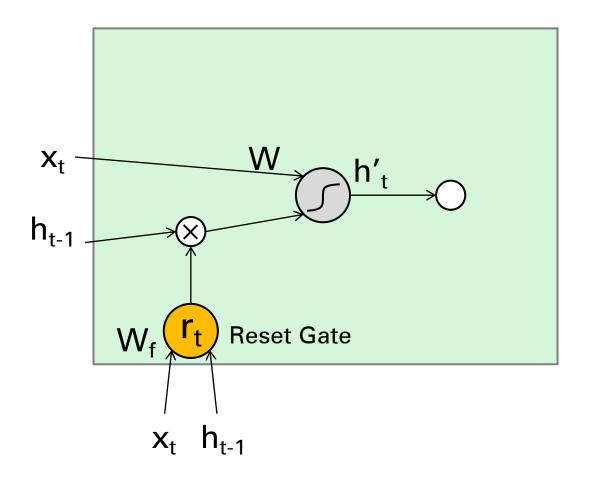

$$z_{t} = \sigma \left( W_{z} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{f} \right)$$

$$h_{t} = (1 - z_{t}) \otimes h_{t-1} + z_{t} \otimes h'_{t}$$

$$r_{t} = \sigma \left( W_{r} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{f} \right)$$

computes a **reset gate** based on current input and hidden state

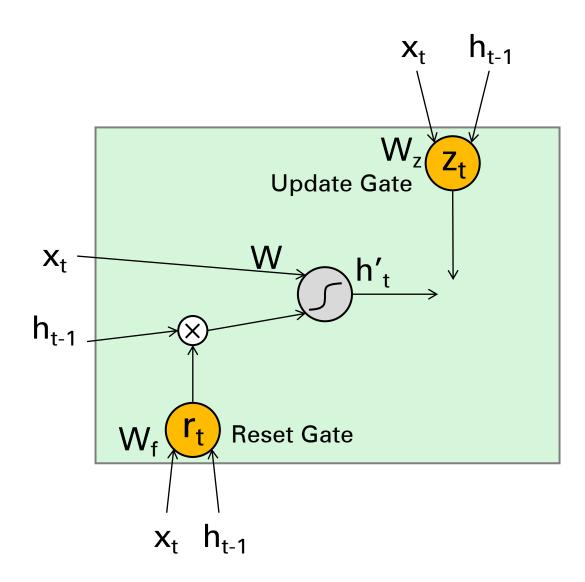

$$r_{t} = \sigma \left( W_{r} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{f} \right)$$

$$h'_{t} = \tanh W \begin{pmatrix} x_{t} \\ r_{t} \otimes h_{t-1} \end{pmatrix}$$

computes the **hidden state** based on current input and hidden state

if reset gate unit is ~0, then this ignores previous memory and only stores the new input information

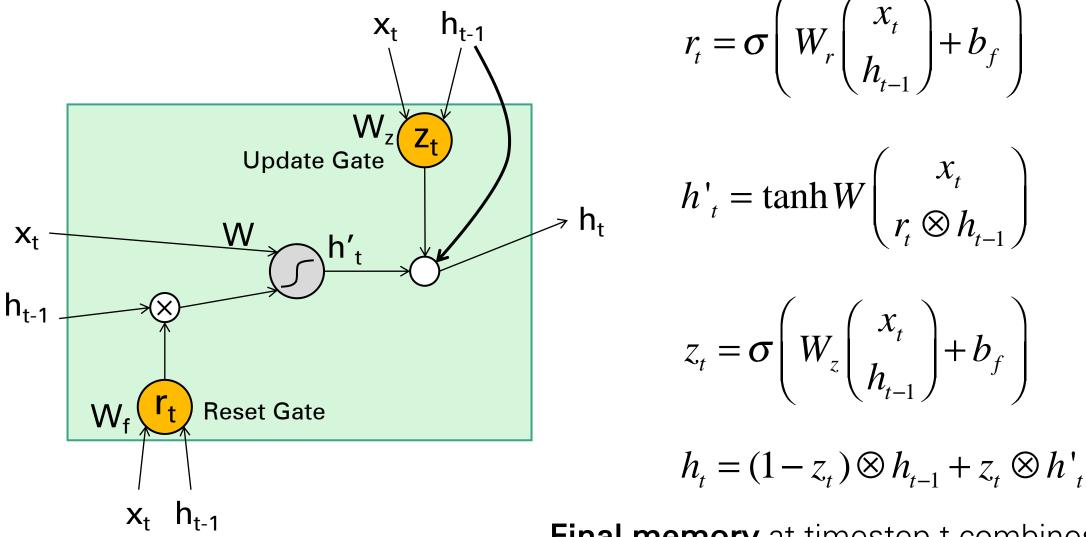

$$r_{t} = \sigma \left( W_{r} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{f} \right)$$

$$h'_{t} = \tanh W \begin{pmatrix} x_{t} \\ r_{t} \otimes h_{t-1} \end{pmatrix}$$

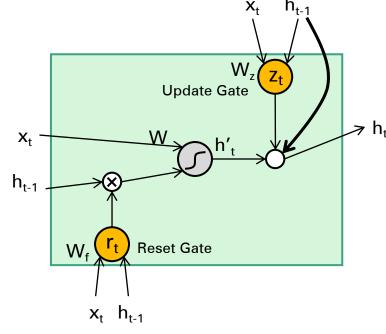

$$z_{t} = \sigma \left( W_{z} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{f} \right)$$

computes an **update gate** again based on current input and hidden state

**Final memory** at timestep t combines both current and previous timesteps

## GRU Intuition

$$r_{t} = \sigma \left( W_{r} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{f} \right)$$

$$h'_{t} = \tanh W \begin{pmatrix} x_{t} \\ r_{t} \otimes h_{t-1} \end{pmatrix}$$

$$z_{t} = \sigma \left( W_{z} \begin{pmatrix} x_{t} \\ h_{t-1} \end{pmatrix} + b_{f} \right)$$

$$h_{t} = (1 - z_{t}) \otimes h_{t-1} + z_{t} \otimes h'_{t}$$

- If reset is close to 0, ignore previous hidden state
  - > Allows model to drop information that is irrelevant in the future
- Update gate z controls how much of past state should matter now.
  - If z close to 1, then we can copy information in that unit through many time steps! Less vanishing gradient!
- Units with short-term dependencies often have reset gates very active

#### LSTMs and GRUs

#### Good

• Careful initialization and optimization of vanilla RNNs can enable them to learn long(ish) dependencies, but gated additive cells, like the LSTM and GRU, often just work.

#### Bad

 LSTMs and GRUs have considerably more parameters and computation per memory cell than a vanilla RNN, as such they have less memory capacity per parameter\*
